The determination of added sugar in jams (containing starch sirup). C. L. Jungius. Amsterdam. *Chem. Weekblad* 12, 612–3(1915).—The assumptions made are that the fruit used contains the av. content of sucrose found in ordinary ripe fruit, and that equal parts of fruit and sugar (or sugar + starch sirup) were used. If x =

Digitized by Google

total invert sugar after Clerget, y = % starch sirup, P = rotation in saccharimeter degrees after Clerget, and R = the amt. of invert equivalent in reducing power to 100 parts jam, then $-0.01(43 - 0.5t)0.95x + 1.6y = P$ and $x + 0.4y = R$. In most cases $P/R = 4$; hence $x = (4R - P)/[4 + 0.0095(43 - 0.5t)]$. If P/R is not 4, this is to be changed to correspond. If a = % sucrose in the fruit used, s = % sucrose added and $f = 1 + 0.01a$, then when sucrose alone is used, $s = 0.95\ x/f$. If starch sirup is also used, $s = (0.95x - 0.01ay)/f$. W. L. BADGER.

The detection of tallow in pork fat according to the procedure of A. Bömer. J. RÜHLE, F. BENGEN AND J. WEWERINKE. *Z. Nahr-Genussm.* 30, 59–66(1915).—In corroboration of Bömer's results (*C. A.* 8, 1174) it was found: (1) Mixts. of pork fat and tallow can be detected when containing small quantities of the latter. (2) Solid animal and vegetable fats in pork fat behave like tallow in the Bömer test. Solid vegetable fats mixed with pork fat can be detected by the phytosteryl acetate reaction. (3) The degree of solidity of the animal and vegetable fats affects the m. p. difference. (4) Natural vegetable oils in mixts. of pork fat and tallow do not hinder the detection of the latter in the m. p. test. LOUIS D. ELLIOTT.

Standards for determining the purity of milk. H. W. CONN. *Pub. Health Reports* 30, 2349–95(1915).—A series of tests was made in which the loop method was compared with the pipet. The effects of the compn. of the media, the amt. of diln., shaking of samples, method of counting, method of inoculating and period of incubation, were studied and comparison of direct microscopic examn. with plating was made. Conclusions: The loop method is irregular and hence should be discarded for the pipet method; the compn. of the media is immaterial in comparison with errors due to technic; the sample should be dild. so that the count on the plates will be between 40 and 200. Since the vigor and extent of shaking to which samples of milk are subjected cause wide variations, shaking should be eliminated. There is no difference in results whether milk is directly inoculated in Petri dishes and the agar poured upon it, or whether the milk is inoculated in the tube of melted agar and then poured into the Petri dish. Five days' incubation (48 hrs. at 37° and 72 hrs. at 20°) gives very slightly greater count than a 2-day incubation. In making a comparison of the plate count with the microscopic, the latter should be a count of groups rather than individuals, plate colonies representing groups only; experience is necessary to distinguish between dirt particles and bacteria, especially micrococci, since raw fresh milk contains few dead bacteria. The microscopical method is of no use in the study of pasteurized milk, but is of value in telling the age of the milk before pasteurization; it also is of value to the dairyman as a guide in grading his product for market. Counting on plates causes much irregularity; it should be done by the use of a lens of $3^1/_2$ diam. In the plating of cream, the inoculation should be made in the agar tube followed by thorough agitation, since plate inoculation is unreliable. J. GAUB.

The process of coagulation in Sardo sour milk. F. FIDANZA. Univ. Sassari. *Arch. farm. sper.* 20, 166–79(1915).—The curdling of this beverage is essentially a pptn. of the casein by the org. acids produced by the bacteria. Coagulation occurs in 6 to 8 hrs. at the optimum temp. of 35–45°. It is prevented by formalin, thymol, $HgCl_2$, phenol, and $CHCl_3$, and retarded by NaOH, Na_2CO_3, $CaCl_2$, $BaCl_2$ and $(CH_3)_2CO$. CHI_3 is without effect. A. W. DOX.

Contributions to the catalase determination in milk. J. PRITZKER. *Z. Nahr.-Genussm.* 30, 49–59(1915).—The catalase no., *i. e.*, the no. cc. O which corresponds to 100 cc. milk, is a valuable test on market milk. The catalase no. of a good milk should not be above 35 which is considered to be the "suspicion point." The app. for the detn. should be as simple as possible to allow of its use in the field in examn. of milk fresh from the cow. The catalase app. described by P. fulfills this requirement. It consists of

Digitized by Google

a small tube sealed at one end, having a vol. of a little over 15 cc. and graduated to 0.1 cc., beginning at the closed end. Near the open end a small outflow tube is attached. Add 10 cc. milk and 5 cc. of 1% H_2O_2 to the app.; fit a rubber stopper into the open end till it touches the soln. at the 15 cc. mark and no air bubbles are left. With the stoppered end underneath put the tube vertically in a warm place (22–25°). After 2 hrs. the gas vol. is read. To obtain the accurate catalase no., a correction factor was worked out: $V_1 = V + \frac{V^2}{30}$, in which V_1 = the corr. vol.; V = vol. read off.

LOUIS D. ELLIOTT.

The pepsin-rennin question in the ripening of cheese. W. VAN DAM. Hoorn, Holland. *Centr. Bakt. Parasitenk., II Abt.* 44, 89–101(1915).—The author discusses at length the most recent views of the relation of pepsin and rennin in the process of cheese ripening. JULIAN H. LEWIS.

Bacteriological and chemical researches on defective cheese. J. THÖNI AND O. ALLEMANN. *Centr. Bakt. Parasitenk., II Abt.* 44, 101–115(1915).—In 4 samples of Emmenthaler cheese that were defective in their ripening, obligate anaerobic bacteria of the true butyric acid and putrefactive groups were found in relatively large numbers. The long rod-formed lactic acid bacilli, characteristic of normal Emmenthaler cheese, were few in number or entirely missing. There is found in these cheeses high fatty acids, as butyric, caproic, and valerianic acids. In 2 of the samples there was a marked disintegration of protein. Isolated putrefactive bacilli from these samples, in media containing milk and casein, produced a disintegration of the protein with the formation of products of the amino group, and caproic, valerianic, propionic, and acetic acids. In isolated cultures of the butyric acid group, there was only a small amt. of disintegration of protein but much fermentation of lactose with the formation of butyric, propionic, and formic acids. There is no doubt that these bacteria are the cause of the failure in the proper ripening of the cheese. JULIAN H. LEWIS.

The sugar beet and the products derived from it (pulp, sirup, sugar) as raw materials for bread making. M. P. NEUMANN. *Z. Ver. Zuckerind.* 65, 215–25(1915).—Bread made of 5 parts rye flour and 9 parts freshly rasped sugar beets was unsatisfactory in size and shape of loaf, consistency, and crust. The taste was suggestive of red beets. If the rasped beets stood a very short time the oxidation went far enough to render the bread much less desirable on all counts. If the beets were cooked before being rasped the bread was heavy and moist, the crust normal, and the beet taste barely discernible. Beet flour (*a*) and pulp flour (*b*) of the following analyses were used: protein (*a*) 4.1, (*b*) 5.6; fat, (*a*) 0.2, (*b*) 0.6; sugar (*a*) 60.4, (*b*) 36.1; crude fiber, (*a*) 4.7, (*b*) 9.8; N-free ext., (*a*) 22.2, (*b*) 32.7%. Bread was made with both 5 and 10% of each flour. With (*a*) very good bread was obtained, with a sweet taste hardly suggesting beets in the 5% loaves. With (*b*) the color, taste, odor, and other properties were poorer but it is concluded that the material can be of service. Replacing 5% of rye flour with sugar in the form of a sirup of 40% sucrose and 40% invert gave a normal bread with a slightly sweet taste. Bread was made containing 3% (on the wt. of flour) of beet molasses, molasses from the SrO process, and table sirups from molasses (80 Bx. 48% sucrose, 59 purity). Rizing and baking were normal, crumb excellent in all respects, color a little darker, and crust unusually good. The taste and odor of molasses were imperceptible to persons who did not know molasses had been used. With 6% the loaf was not so good and the taste and odor were plainer. All the above materials are recommended for general use except rasped beets and molasses in amts over 5%. W. L. BADGER.

Increasing the supply of bread materials. S. THIELER. *Centr. Zuckerind.* 23, 457(1915); *Wochschr. Zentralver. Rübenzuckerind.* 53, 264(1915).—Rye meal with 10%

Digitized by Google

raw beet sugar and 1% NaCl makes good bread. The addition of sugar beet flour (cf. C. A. 9, 2158 and preceding abstr.) makes a bread that is palatable, satisfying, and keeps fresh very long. Beets to be dried must be sound, well washed, and free from coal ash. W. L. BADGER.

The preparation of bread from starch. W. OSTWALD AND A. RIEDEL. *Kolloid-Z.* 17, 12–4(1915).—Pure starch from potatoes, tapioca, etc., without the addition of wheat flour, does not make a good loaf of bread, because as Fornet has pointed out (*C. A.* 9, 2406), the dough is too short and inelastic to hold in the gas from the baking powder or yeast. The present military necessities make a starch loaf desirable; by mixing the dough made with starch and yeast or baking powder with a stiff (30%) starch paste to the extent of 15% of the total weight, a satisfactory loaf, with a good crumb, can be obtained. Such a loaf is tasteless, and means of flavoring must be developed. H. I. MATTILL.

Use of rice in bread-making. N. NOVELLI. *Giorn. risiculture* 5, 68–72(1915); *Bull. Agr. Intelligence* 6, 749–50.—The Exptl. Sta. on Rice Culture at Vercelli in conjunction with the Assoc. of Vercelli Agriculturists has carried out expts. in bread-making using wheat flour mixed with 20% of rice flour, the latter being freed only from the chaff so as to retain its superficial layers of the mesocarp which are rich in N. The bread thus obtained could not be distinguished by its organoleptic properties from full wheat bread. Analysis of white bread in small loaves made from (*a*) wheat flour only and (*b*) 80% wheat flour plus 20% rice flour gave the following results: water (*a*) 27.8, (*b*) 27.7; ash (*a*) 0.85, (*b*) 0.90; crude protein (*a*) 10.00, (*b*) 9.87; crude fat (*a*) 0.82, (*b*) 0.25; cellulose (*a*) 0.37, (*b*) 0.32; N-free ext. (starch, dextrin, sugar), (*a*) 60.70, (*b*) 60.96%. E. J. C.

The use of blood for food. F. HOFMEISTER. *Münch. med. Wochschr.* 62, 1106–8, 1146–50(1915).—The important factor in the nutritional value of blood is its protein. The utilization of blood protein, as shown in expts. on animals and man, is quite satisfactory. The proteins of the serum are utilized as well as meat protein, those of the red blood corpuscles less. For several years a bread, "esthnic blood bread," has been made with addition of blood; it has been in use in some parts of Russia. Its dark color prevented its more general introduction. A difficulty is found in that the blood has to be used fresh, as it does not keep well. To overcome this difficulty it is necessary to obtain the blood in powder form. A satisfactory prepn. can be made using defibrinated blood, coagulated by boiling under certain precautions with H_3PO_4. The water is drained off the ppt. by colation and the remaining portion pressed out under high pressure. The residue is driven through a sieve and dried in a thin layer in a current of air at a temp. not exceeding 50°. The mass is easily made into a fine flour. It is insol. in water but disperses easily without swelling. It contains 9.12% H_2O, 13.66% N (= 80% protein), 1.28% ether ext., 2.11% ash. This prepn. can be used for making bread and can be added to various other foods. But it is still colored. The best results were obtained in the following manner: Two-hundred cc. defibrinated blood were heated on the water bath cautiously, to a temp. close to the coagulation temp. (about 65°), then under constant stirring poured into 200 cc. of water containing the necessary amt. of H_3PO_4 and kept boiling until the red color had disappeared. While cooling 3% H_2O_2 was added with stirring until the grayish brown ppt. takes on a clay-yellow color. After standing several hrs., the water was removed in the manner described above. By adding more H_2O_2 and letting it act longer, a nearly white ppt. can be obtained. An excess of H_3PO_4 is to be avoided. The coagulum treated with H_2O_2 keeps better than one not so treated. A prepn. obtained in this manner called "Sanol" contained 13.56% N. It can be used for baking bread, etc. The coagulated blood does not contain those substances which prevent the peculiar nervous symptoms which are

Digitized by Google

seen in white mice after 3 weeks' feeding with the finest wheat flour and which are preventable by bran and yeast. "Sanol" could be manufactured on a large scale, so that its price would fall far below that of the cheapest food protein of the present time (cod fish protein). S. AMBERG.

Bread making and butyric ferment in Latium. R. PEROTTI AND U. CRISTOFOLETTI. *Stas. sper. agrar. ital.* **48**, 331; through *Ann. chim. applicata* **4**, 129(1915). —P. and C. isolated *Clostridium butyricum* and *Saccharomyces minor* from the ordinary leaven of Velletri bread, and studied the conditions of nutrition and functioning, and the best means of artificial nutrition. They attribute the good qualities of the Velletri bread to the moderate presence of butyric fermentation in it. S. LEVY.

Nutritive value of wheat flour and of bread in relation to phosphorus fertilizers. G. MASONI. *Stas. sper. agrar. ital.* **48**, 385(1915); through *Ann. chim. applicata* **4**, 129–30.—The total amt. of P, relatively scarce in the finest flour, increases continuously as the grade deteriorates, and still more so in the secondary products, becoming a max. in bran. The complexity of the organic P compds. depends on that of the mineral compds. Phytin predominates, then nuclein, and finally lecithin. The quantities of phytin and lecithin compds. increase with increase of total P. The % of mineral substances and of ether ext. increases from flour to bran. The phytin and nuclein P occurs practically in the same proportions in flour as in bread, allowing for the latter's greater moisture, but the proportion of lecithin P is very much less in bread, probably owing to the ease with which lecithin may be decomposed by temps. above even 60°. M. concludes that wheat flours of inferior quality, *i. e.*, dark flours, and hence the bread made therefrom, have a greater direct and indirect nutritive value than the finer and whiter flours, considering them from the view-point of P compds., and also from that of the common food principles, since the inferior flours also show a greater richness in nitrogenous substances, in crude fat (ether ext.), and in complex mineral substances. S. LEVY.

The character of the water-soluble nitrogen of some common feeding stuffs. E. B. HART AND W. H. BENTLEY. Univ. Wisc. *J. Biol. Chem.* **22**, 477–83(1915).—In the aq. exts. of the feeding stuffs studied, the N not pptd. by Stutzer's method (*J. Landw.* **28**, 103(1880)), was not amide N but consisted largely of the N of free amino acids and of polypeptides. In most cases, these contained from 50 to 75% of the total H_2O-sol. N. The acid-amide N was generally below 10%, almost always below 20% and only in the case of corn stover over 40% of the total H_2O-sol. N. The NH_3-N rarely exceeded 5% of the H_2O-sol. N and in some cases was wholly absent. I. GREENWALD.

The adulteration of bran. O. LOPRIORE. *Stas. sper. agr. ital.* **48**, 297–312(1915). —Adulteration is effected by adding vegetable and mineral substances, *viz.*, peanut shells, rice hulls, corn cobs, vegetable ivory, sawdust, etc. The use of peanut shells is easily noted by the smell of rancid oil and by the microscopic observation of the fibrovascular tissue. Rice hulls are detected by use of the microscope. Sawdust may be detected by letting bran ferment; it develops the odor of acetic acid. Vegetable ivory may be detected by use of the microscope and by the high ash content. The presence of these substances appreciably decreases the food value. Tables show compn. and % digestibility of peanut shells, coffee bran, buckwheat- and rice-hulls. J. A. LECLERC.

Oats substitutes. THESER. *Wiener Landw. Ztg.* **65**, 281(1915).—T. describes 72 different mixts. which have the same content in starch, protein, fat and dry matter as a mixt. of 4 pts. oats to one of straw. Among the components of the substitutes are several kinds of hay and straw, wheat and corn bran, corn, horse beans, malt sprouts, molasses and the press cakes of corn, palm and flax seeds. The composition of each

Digitized by Google

of these substances as regards starch, fat, dry material and protein content is also given. C. F. MILLER.

The utilization of total brewery waste for feeding purposes by means of a new preservation process. ULRICH. *Z. öffent. Chem.* 21, 85–90(1915).—The preservation process which is not described is said to be legal and entirely harmless. Numerous analyses of the preserved material are reported. P. B. DUNBAR.

Sea weed as a source of fodder. E. BECKMAN. *Sitzb. kgl. preuss. Akad. Wiss.* 1915, 645–51.—B. gives results of work done on sea weed from the coasts of England, Norway and America. In addition its value as a source of I and salts of K the food value is given. In the analysis of the samples from the various coasts, protein, fat, starch, crude fiber, ash, KCl and I were detd. Similar detns. were made on wood to show the relative values of each. P. J. DONK.

Determination of food value of wood and straw. E. BECKMAN. *Sitzb. kgl. preuss. Akad. Wiss.* 1915, 638–44.—The analysis of several kinds of wood for N, fat, starch and ash was carried out according to the following methods: N, by Kjeldahl, sample 1.5–2 g., factor for protein 6.25. Fat, Soxhlet, ether extn., sample 10–12 g. Starch, digestion under pressure with water at 108–110°, hydrolyzing with 25% HCl, detg. the hydrolyzed substance by Fehling method, sample about 5 g. Ash, slow incineration with gradual heating to low redness to const. wt., in a Pt crucible, sample about 3 g. The compn. of the kinds of wood analyzed are as follows: Protein 1.15–2.04%, fat 0.37–1.35%, starch 0.95–5.90%, ash 0.68–0.91%. The analysis of straw gave reducible substances (calcd. as starch) 26.12%, fat 3.61%, and ash 9.98%. P. J. DONK.

Disintegrated straw for fodder. F. LEHMANN. *Deut. Zuckerind.* 40, 317(1915); *Wochschr. Zentralver. Rübenzuckerind.* 53, 341(1915).—In order to supply the lacking protein disintegrated straw is treated with $(NH_4)_2SO_4$ and Na_3PO_4 and allowed to heat. After this it is inoculated with molds and by their growth the entire mass becomes filled with mycelia, which contain the desired protein so that the material is equivalent to bran. The selection of the most desirable molds is not yet finished. An editorial note warns that this is unaccompanied by analyses or feeding tests, and is to be discounted until such data are furnished. W. L. BADGER.

EDWARD BARTOW.

Report on water. W. W. SKINNER. *J. Assoc. Off. Agr. Chem.* 1, 97–9(1915).—Study of methods for Sr, I, and Br gave results which were generally satisfactory, but it is considered unwise to recommend the methods for adoption as official until further work has been done. W. H. FRY.

Estimation of carbon dioxide in common natural waters. ALFREDO CAVAZZI. *Ann. chim. applicata* 4, 81–91(1915).—The method consists in liberating all the CO_2 of a water under examn. by addn. of dil. H_2SO_4, warming, absorbing the CO_2 set free in an ammoniacal soln. of $CaCl_2$, and detg. the quantity of $CaCO_3$, with titrated solns. of HCl. The $CaCl_2$ soln. is made by dissolving 2.5 g. fused $CaCl_2$ in 40 cc. boiling H_2O in a flask to which are added 20 cc. concd. NH_4OH, then loosely stoppering the flask (rubber stoppers are used throughout), and keeping the soln. near the b. p. for

Digitized by Google

45 min. The soln., always more or less turbid, is poured warm on a filter, and the filtrate collected in a flask of slightly over 60 cc. capacity; the flask is quickly closed tightly and the liquid allowed to cool. In 1 l. H_2O dissolve 20 g. dry NaOH to form approx. a 0.5 *N* soln. In a 500 cc. flask add enough H_2O to 25 cc. fuming HCl to make exact vol. Titrate 20 cc. of this soln. with the NaOH soln. (Me orange is used in all titrations); the result indicates the quantity of H_2O to be added to the remaining 480 cc. to make approx. a 0.5 *N* soln. Then det. exactly the number of cc. of the NaOH soln. to neutralize 30 cc. of the HCl soln. Into a beaker contg. exactly 0.5 g. pure, dry, pptd. $CaCO_3$ add 30 cc. of the HCl soln.; when the $CaCO_3$ is dissolved, titrate with the NaOH soln. If 30.1 cc. NaOH soln. neutralized 30 cc. HCl soln. and 9.95 cc. NaOH soln. was necessary to neutralize the excess of HCl which dissolved the $CaCO_3$, then 20.15 cc. HCl soln. were equiv. to 0.5 g. $CaCO_3$, and this ratio is used in calcn. in the actual analysis. The app. consists of a 2 l. Erlenmeyer flask as generator, connected by a slightly downwardly inclined tube about 50 cc. long, then a vertical tube about 60 cc. long, to a 150–200 cc. Erlenmeyer flask used as a collector and contg. the ammoniacal $CaCl_2$ soln. The vertical tube extends through the stopper to within $^1/_2$ inch of the bottom of the flask, which rests in a dish contg. 3.4 l. cold H_2O. By an upper lateral tubulure, the collector is joined with 2 U-tubes each contg. about 8–10 cc. of the same $CaCl_2$ soln. in the bends, the inner U-tube to catch the last traces of CO_2 and the outer U-tube to act as a check on the CO_2 of the outer air. Before filling the generator with the water to be analyzed, and the collector with the $CaCl_2$ soln., there should be passed into these vessels air that has gone through solid NaOH-CaO, and then through 50% KOH soln. to remove CO_2 which would introduce considerable error into the results. The H_2O to be analyzed should be taken at the spring or source in large, rubber-stoppered bottles into which CO_2-free air has been previously passed. The completely filled bottles should stand in cold H_2O for about an hr. before opening. The collector is file-marked at the neck, the capacity up to this mark having previously been detd. The sample H_2O is siphoned into this flask to the mark, 150 cc. of it removed by a pipet, some small pieces of pumice-stone dropped in, 15 cc. cold 1:3 H_2SO_4 added, and the flask stoppered, all these operations being done as quickly as possible. The flask is now warmed, preferably by a ring burner, which is regulated as fully as possible, but so that not more than 30–35 bubbles of gas pass through the collector per min. Care should be taken towards the end when near the b. p. of the liquid to lower the flame sufficiently to produce only a gentle boiling, which is continued for about 30 min., increasing the flame at the end of the period to give stronger ebullition, till no more bubbles come over. The condensed H_2O should reach a blue pencil mark on the outside of the collector indicating a vol. of 130–140 cc. The boiling is continued still stronger for 3–4 min. The whole operation should last at least $1^3/_4$ hrs., and if properly conducted only traces of $(NH_4)_2CO_3$ should pass over into the 1st $CaCl_2$ U-tube. The upright tube is now disconnected from the horizontal tube, the gas extinguished, the side tubulure of the collector stoppered, the upright tube and its stopper removed and the adhering $CaCO_3$ scrubbed and washed off into a beaker and then into the collector, into which also is poured the liquid and washings from the 1st $CaCl_2$ U-tube. Then stoppering the collector lightly, it is placed for 45 min. on a boiling salt bath, stoppered tightly and allowed to cool. If, preferably, this is done in the morning, in the afternoon the liquid should be poured on a medium 9 cm. filter, the filter washed 4 times with cold H_2O, using 20 cc. each time and rinsing over the $CaCO_3$ on the walls of the collector, then 11 times with cold H_2O contg. 10% concd. NH_4OH, the last portions being 1st used to carry to the filter the $CaCO_3$ on the walls of the collector. The filter is dried in a beaker in a H_2O oven for $1^1/_2$ hrs., then about 2 cc. of 50 cc. of the titrated HCl in a buret allowed to drop into the dried collector, and the remaining 48 cc. poured over the filter in the beaker immediately on removing from

Digitized by Google

the oven. The HCl in the collector, after addn. of a little H_2O, is employed to dissolve the traces of $CaCO_3$ that still adhere to the glass, the liquid poured into the beaker, as also the 3 or 4 rinsings of H_2O that are necessary to take out all the HCl. The excess of HCl is titrated with the NaOH soln., and the CO_2 in the original H_2O calcd. as indicated before. The method may be modified to det. combined CO_2: 2 l. of the sample H_2O are poured into a flask, 1 g. hydrated $CaSO_4$ or pure finely powdered selenite are added, and 0.1–0.2 g. NaCl, the flask well stoppered, and shaken to soln. of the powder. Then the whole is evapd. in a $^1/_2$ l. porcelain dish 1st over the free flame and then on a salt bath nearly to dryness. On cooling, 50 cc. of the titrated HCl are added from a buret, the residue dissolved as completely as may be, the whole filtered and washed through a small filter, and the filtrate titrated with NaOH. A very slight error will be introduced here by partial decompn. of $CaCO_3$ during evapn., if dissolved SiO_2 is present in the H_2O. To det. directly the sum of free and semi-combined CO_2, proceed as in the regular method, but using 1.5 g. hydrated $CaSO_4$ instead of the H_2SO_4, and continue the gentle boiling for a longer time, so that the whole operation should take about $2^1/_2$ hrs. According to C., the advantages of his method are simplicity of operation and app., possibility and ease of employing large quantities of H_2O, certainty of good results. S. Levy.

Estimation of total hardness of water by Blacher's method. Hanns Fischer. *Z. öffent. Chem.* **20**, 377–81(1914); *J. Chem. Soc.* **108**, II, 374; cf. *C. A.* **7**, 1394.—This method was found to be trustworthy but it is recommended that a correction be applied when the H_2O under exam. contains appreciable amts. of Fe or Mn. One mg. per l. of Fe or Mn is equiv. to 1 p. p. m. hardness (as $CaCO_3$). H. A. Lepper.

Disturbing influence of colloids in hardness determinations according to Clark. J. D. Ruijs. *Chem. Weekblad* **11**, 599–602(1914).—An address delivered before the Delft Natuurwetenschappelijk Gezelschap, in which it is pointed out that the Clark method gives decidedly low results in the presence of colloids. G. W. Morey.

Lead-dissolving power of water in drinking water conduits of Enschede. J. Rodenberg. *Chem. Weekblad* **12**, 494–7(1915).—The H_2O used is a moor H_2O containing much Fe. The Fe was formerly removed by a pptn. method, but is now removed by aeration. Changing the purification method resulted in a smaller solvent power for Pb, due to a diminution in the free CO_2 content of the water. G. W. M.

Detection of nitrous acid in drinking water. L. Rosenthaler and V. Jahn. *Apoth. Ztg.* **30**, 265–6(1915).—As the result of tests with the more common reagents, it was found that indole as applied by Dane (*C. A.* **5**, 2379) gave the most satisfactory results. W. O. E.

Colloidal and catalytic properties of mineral waters of Roumania. Complications due to the presence of salts. E. Giurgea. *Bull. acad. sci. Roumanie* **2**, 192–201 (1914); *J. Chem. Soc.* **108**, II, 330(1915).—The colloidal and catalytic properties of several spring waters containing S compds. and carbonates are expressed by a number termed the "catalytic coefficient." This is detd. by measuring the quantity of H_2O_2 destroyed by a measured quantity of the water at 37° in 1 hr. The elec. cond. of the same water is also given, and it is shown that the colloidal properties, as measured by the "catalytic coeff.," are not directly related to the cond. F. W. Smither.

Changes in mineral waters on standing in metallic vessels. Emil Giurgea. *Bull. acad. sci. Roumanie* **2**, 303–10(1914); *Chem. Zentr.* **1915**, II, 47.—G. described the destructive action of the concd. mineral waters of Roumania on pipes, and the natural changes which the waters undergo in this process. Stoneware or enamelled clay pipes are recommended in cases where the water is to stand for long periods. The waters retain their conductivity, and therefore their mineral content unchanged for

Digitized by Google

months in such vessels. "Tombac" or Al pipes are to be used for domestic plumbing.
E. B. MILLARD.

A simple colloid-chemical process for removing microörganisms from surface water in relation to the supply of drinking water in the field. M. STRELL. *Münch. med. Wochschr.* 62, 1158–9(1915).—Humin (Wellensick, Hannover) is prepd. from brown coal by treatment with hot NaOH. It is a black doughy mass giving a colloidal soln. with water. When humin is added to polluted water and this mixt. is treated with the soln. of a metal salt like $FeCl_3$, etc., a flocculent ppt. is formed containing finely suspended substances like microörganisms, dyes, native proteins, etc. River water containing 84,960 bacteria per cc. was treated with humin soln. and then $Al_2(SO_4)_3$ soln. was added. After sedimentation the supernatant fluid was filtered to remove the suspended finer particles; the filtrate contained 4–8 bacteria per cc. By a repetition of the process all the bacteria could be removed. In these expts. 5 cc. 10% humin soln. were added to one l. water and then 2.5 cc. 10% $Al_2(SO_4)_3$ soln. The filtration is necessary because the process simply leads to an inclusion of the bacteria; it does not kill them. For the filtration Canton flannel is recommended. The filtrate contains very little $Al_2(SO_4)_3$ and the taste is good.
S. AMBERG.

The water supply of soldiers in the field. CHRISTIAN. *Das Wasser* 1915, 135–40; *Wasser u. Abwasser* 9, 539–40(1915).—Barrels with perforated bottoms containing a layer of stone, sand or ashes serve for the removal of suspended clay, algae or protozoa. Alum may be employed to facilitate sedimentation. If a supply is suspicious its use is prohibited. Portable filters and sterilizers accompany the troops. Each of these portable filters furnishes from 800 to 900 l. of sterile water in 1 hr. Halogen compds. serve for the sterilization of the water supply of the individual soldier. Antiformin and bleach may be used. The French sterilize water by the aid of ultraviolet rays. The efficiency of this process is greatly impaired by turbidity. Berkefeld filters are employed to advantage. A portable outfit with 7 candles can furnish 2000 l. per hour.
ARTHUR LEDERER.

The present state of refuse incineration and recovery. E. H. STECK. *Feuerungstechnik* 3, 281–5(1915).—Several furnaces and installations for the incineration and recovery of by-products of refuse are described with detailed drawings. The growth of the practice of incinerating refuse and the improvements of furnace construction are reviewed. It is stated that rich refuse may be used as fuel for steam production, and the poorer materials may be burned and the residue melted for the production of artificial stone.
H. R. GUNDLACH.

Further experiments in the destruction of fly larvae in horse manure. F. C. COOK, R. H. HUTCHISON AND F. M. SCALES. U. S. Dept. Agr., *Bull.* 245, 22 pp.(1915); cf. *C. A.* 9, 1359.—The larvicidal effect was investigated of arsenical dip, $CaOCl_2$, $MgSO_4$, lime-sulfur, H_2SO_4, $PhNH_2$, β-$C_{10}H_7OH$, cresylic acid, p-$Cl_2C_6H_4$, HCHO, $PhNO_2$, $H_2C_2O_4$, C_5H_5N and a number of plant materials. The effects of these substances on the fertilizing value of manure and on plants were studied by chem. and bacteriological analyses and by field tests. Most of those which are effective and not injurious are too expensive to be practicable. Hellebore is recommended as superior to the above materials and it has the advantage over borax, which was recommended in the previous bulletin, that it is not injurious to plants when applied in any amt. It is a little more expensive than borax.
E. H.

The air of Bucharest. ST. MINOVICI AND E. GROZEA. *Bull. acad. sci. Roumanie* 2, 275–86(1914); *J. Chem. Soc.* 108, II, 334(1915).—M. and G. report a large number of detns. of the amts. of dust, CO_2, and O_2 present in the air of Bucharest. The analyses of the dust were made from air at a height of 1.5 m. from the pavement. Thirty analyses

Digitized by Google

showed the following mean quantities per cu. m.: in streets paved with asphalt, 0.0062 g.; in streets paved with stone blocks, 0.0066 g.; in earth-paved country roads, 0.0534 g. These results are compared with similar results obtained in Berlin and Dresden. Microscopic examn. with dust deposits from the same sources shows that the country roads give a dust containing a large quantity of angular particles; that from asphalt-paved roads contains a quantity of org. fibers. The av. of more than 100 detns. shows 3.02 parts per 10,000 of CO_2 for the city itself, and 2.81 per 10,000 for the surrounding plain. Out of 95 qual. tests made between June and Dec., 1914, for the presence of O_3, 48 gave positive results. Hence, apart from the large quantity of dust, the air of Bucharest compares very favorably with that of other large European towns.

App. for **purifying back waters** and drinking water, wherein the H_2O, before entering the clarifying chamber, is broken up into drops and conducted into the chamber through a restricted opening about midway between the surface of the H_2O and the sludge outlet.

15. SOILS AND FERTILIZERS.

R. O. E. DAVIS.

Probable combination of the chlorine ions in alkali salts. R. F. HARE. New Mexico Expt. Sta., *Bull.* 95, 3–6(1915).—Expts. indicate that heating the residue of

Digitized by Google

chlorides from a water or soil soln. at a low red heat for 10 minutes might furnish a method for detg. the Cl in combination with Mg in mixed alkali salts, the loss in Cl representing the amt. in combination with Mg. By heating $MgCl_2$ alone for 10 minutes at a low red heat it loses 95.65% of its Cl; $CaCl_2$ loses 6.19% and NaCl 4.01%.
R. C. ROARK.

A review and discussion of some of the methods for the determination of alkali in soils. R. F. HARE. New Mexico Expt. Sta., *Bull.* 95, 7–16(1915).—A comparison of results obtained for black alkali in soils by 3 diff. methods is presented in tabular form; the methods are the New Mexico, modified Calif. and modified Arizona. Largely a discussion. R. C. ROARK.

New methods of measuring concentration of soil solutions around the soil particles. G. BOUYOUCOS AND M. M. MCCOOL. *Science* 42, 507–8(1915).—F. ps. of different soils with varying amts. of moisture were detd. by the ordinary f. p. method. Solidification started when the mass was supercooled only 0.2°. The method may be used with very low moisture content. Lowering of f. p. and concn. of soln. vary directly with the amt. of H_2O present. F. p. detns. of nutrient soln. alone and with different soils showed that the lowering of f. p. of solns. with soil varies little from that of solns. alone.
R. O. E. D.

Report on soils. G. S. FRAPS. *J. Assoc. Off. Agr. Chem.* 1, 33–9(1915).—There is more variation in the results secured by the lime-water method for soil acidity than is desirable, but the method is useful in distinguishing soils which are acid and in showing in a general way their lime requirements. A clear humus filtrate may be obtained by the method of transferring soil to filter (cf. *C. A.* 7, 854) but the filtrate contains colloidal mineral matter which is pptd. by $(NH_4)_2CO_3$. It is believed that the removal of lime by washing on a filter under a filter disk, the removal of acid by washing with successive portions of carbonated water in a closed bottle or cylinder, the subsequent extn. of the humus by the official method, and the completion by $(NH_4)_2CO_3$ and repptn. would form a satisfactory method for humus. The method of White gave unsatisfactory results. It is believed that a method for humus in which there is only a single extn. with acid would not be satisfactory. It should, however, be possible to devize one with 2 extns. which should be sufficient, provided that the first extn. took out almost all the lime. It is recommended that the Rather modification of the method for humus be adopted as official. W. H. FRY.

Humus determinations. O. C. SMITH. *J. Assoc. Off. Agr. Chem.* 1, 46–8(1915).—For a certain soil, the official and original Rather methods are wholly inadequate and the modified Rather method introduces too many doubtful factors. W. H. FRY.

Report on nitrogenous compounds in soils. J. K. PLUMMER. *J. Assoc. Off. Agr. Chem.* 1, 49–54(1915).—Lime is the best agent known for the clarification of soil exts. in which nitrate detns. are to be made. The absorptive power of the Chamberland-Pasteur filter tube would tend to debar this app. for such work. The amt. of CaO necessary for removal of clay varies in different soils, but 2 g. is about all that is needed for 100 g. of most loam soils. The Chamot modification, except in 2 instances, gave higher results than the Gill method on the soil alone, and in every case where KNO_3 was added. Agreement was remarkably close when CaO was used. Use of Al cream is questionable. W. H. FRY.

Potassium from the soil. E. W. HILGARD. Univ. Cal. *Science* 42, 527–8 (1915).—H. reviews and criticizes the work of Hopkins and Aumer (cf. *C. A.* 9, 2416) and calls attention to the work of Loughridge (*Am. J. Sci.* (1873)), wherein it was shown that only one-half of the total K extd. by HCl (d. 1.115) was obtained during the first 24 hrs., and 5 days were required for complete extn. Notwithstanding this demon-

Digitized by Google

stration the Assoc. of Official Agr. Chemists adopted a 10-hr. digestion. It is suggested that expts. be made by growing plants on the residue from a digestion carried to the limit of acid solubility. L. W. RIGGS.

Differences in lime requirement as indicated by the Veitch method. A. W. BLAIR AND H. C. MCLEAN. *J. Assoc. Off. Agr. Chem.* 1, 39–43(1915).—Extreme accuracy cannot be claimed for this method. Results of plot expts. do, however, seem to make it certain that the method may be depended upon to show differences in lime treatment within reasonable limits and that it may be used as a safe guide in detg. the amt. of lime to be applied for different crops. W. H. FRY.

Physico-chemical soil investigation. III. Moisture relations of the soil and vegetation. U. PRATOLONGO. *Stas. sper. agr. ital.* 48, 44–55(1915).—Expts. carried on with oats, wheat, vetch, mustard, and flax showed that there exists a relation between the water content of soils and the beginning of plant growth. The various plants show no appreciable differences in behavior during the drying of the soil. Cf. following abstr. J. A. LECLERC.

Physico-chemical studies on soil. IV. Causes of fixation of phosphoric acid by soil. U. PRATOLONGO. *Stas. sper. agr. ital.* 48, 456(1915); through *Ann. chim. applicata* 4, 130–1; (cf. preceding abstr.).—The phenomenon of H_3PO_4 fixation by the soil, considered from a general viewpoint, is the result of various reactions, their relations or the prevalence of one or the other in the complex process depending on the exptl. conditions under which the phenomenon, which may be assumed to be one of absorption, is carried out. This fact is demonstrated by the nature of the relations which connect the quantity of H_3PO_4 absorbed to the final concn. of the solns., by the behavior of the absorbed H_3PO_4 in respect to redissoln., and by the kinetic study of the process. If a soil free of limestone comes into contact with a soln. of a monometallic phosphate, the H_3PO_4 so fixed combines in the soil to form compds. of absorption with the electropositive colloids of the soil, hence with the hydroxides of Fe, Al, and Mn. If limestone is present in the soil, a fixation of H_3PO_4 as Ca phosphate takes place. On account of the different velocities with which these processes react, it will happen, if the time of contact between soil and soln. is short enough and the soil is in great excess with respect to the H_3PO_4, conditions which occur in practice, that the 2nd process of fixation will have only a limited and negligible importance, compared with the predominance of the 1st process. If the soil comes into contact with solns. of bimetallic alk. phosphates, then besides the previous absorption process, there will occur a secondary fixation, *i. e.*, an exchange of metals between soil and soln., with sepn. of $CaHPO_4$ and $MgHPO_4$. Under these conditions the H_3PO_4 behaves like H_2CO_3, H_2SO_4, H_3AsO_4, uric acid, etc. S. LEVY.

The effect of some organic soil constituents upon nitrogen fixation by Azotobacter. HOWARD S. REED AND BRUCE WILLIAMS. Va. Agr. Expt. Sta., *Tech. Bull.* 4, 81–95 (1915); see *C. A.* 9, 2417. R. C. ROARK.

Nitrogen fixation and nitrification in various soil types. HOWARD S. REED AND BRUCE WILLIAMS. Va. Agr. Expt. Sta., *Tech. Bull.* 3, 59–80(1915).—Of 93 Va. soils studied, the cultivated soils showed decidedly higher nitrifying qualities than virgin soils. In virgin soils, the nitrifying power in the light open sandy soils was strikingly low, in the loams and clay loams it reached its max., and in the heavy clays there was again depression. The high nitrifying power of certain cultivated soils irrespective of texture suggests that this power may be largely increased by proper cultivation. From the results of this investigation it is unwarranted to conclude that soils with high nitrifying power would exhibit also unusual qualities for free N fixation or *vice versa*. Some soils which failed to nitrify $(NH_4)_2SO_4$ in 6 weeks accumulated quite significant amts. of nitrate from their own organic N in 6 months. On the other hand, there were

Digitized by Google

some which nitrified the inorg. medium and failed to accumulate nitrates. There appeared to be no relationship between the ability of a soil to nitrify the 2 types of media. Sand failed to stimulate nitrate formation in clay soils, while lime enormously increased its formation. The general indications from fixation studies which the authors have carried on are that, with the possible exception of lime, the humus content of a soil and its cultivation are the only factors which materially affect fixation. Fertilizers, with the exception of CaO, failed to materially increase the nitrifying power of soils. R. C. ROARK.

Technical application of microörganisms to agriculture. C. E. MARSHALL. *Science* 42, 257–64(1915).—Correction to page numbers given in abstract in *C. A.* 9, 2788. E. J. C.

The effect of association of legumes and non-legumes. W. B. ELLETT, H. H. HILL AND W. G. HARRIS. Va. Agr. Expt. Sta., *Tech. Bull.* 1, 28–36(1915).—With Kentucky blue-grass and white clover grown in the greenhouse no direct benefit was shown by their association, or being adjacent. No increase in protein was shown by the association of timothy and red clover during the 1st year. Growing corn and beans in the greenhouse together benefited the corn. Immature plants have higher percentages of protein than the more mature ones. The question of whether a legume benefits a non-legume under field conditions is still an open one. The authors believe that the soil moisture and N factors exert more influence than could be derived from the association of a legume with a non-legume. A content of 0.4% N in a soil from a field that had remained in blue-grass and white clover for over fifty years indicates that the association of white clover with blue-grass on the grazing lands of Va. may be indirectly responsible for the high protein content of blue-grass. R. C. ROARK.

A report on the Piedmont soils. Particularly with reference to their nature, plant food requirements and adaptability to different crops. C. B. WILLIAMS, *et al.* N. Car. Dept. Agr., *Bull.* 36 [2], whole no. 206, 5–121(1915).—A detailed report, giving analyses and results of field expts. on different types of soils of this section. R. C. R.

The determination of the availability of potash in feldspathic fertilizers by means of pot experiments. M. F. MILLER AND E. E. VANATTA. *J. Assoc. Off. Agr. Chem.* 1, 26–8(1915).—Pot expts. with $NaNO_3$ + dried blood + acid phosphate with (1) KCl, (2) K_2SO_4, and (3) varying amts. of feldspar show greater av. relative wt. of crop for the K_2SO_4 mixt. W. H. FRY.

The perchlorate and gravimetric cobalti-nitrite methods for the determination of potash. T. D. JARRELL. *J. Assoc. Off. Agr. Chem.* 1, 29–32(1915).—Results indicate that $KClO_4$ is slightly sol. in alc. wash and therefore this method gives lower results than the Pt method. $BaCl_2$ is only slightly sol. in 95% alc. J. believes that the gravimetric cobalti-nitrite method for detg. K_2O in fertilizers must be greatly improved before it can be successfully used. W. H. FRY.

Report on phosphoric acid. A. J. PATTEN AND L. S. WALKER. *J. Assoc. Off. Agr. Chem.* 1, 8–17(1915).—Results of several collaborators on methods of detg. P_2O_5 in basic slag are reported, and recommendations for further work are given. W. H. FRY.

Report on nitrogen. C. L. HARE. *J. Assoc. Off. Agr. Chem.* 1, 17–22(1915). —Results of several collaborators on detn. of N in various states are reported. It is recommended that the $FeSO_4$-Zn-soda method be provisionally adopted. W. H. F.

Report on determination of potash. H. B. MCDONNELL. *J. Assoc. Off. Agr. Chem.* 1, 22–24(1915).—It is recommended that further coöperation be secured in testing: (1) the use of denatured alc. for washing K_2PtCl_6, (2) the necessity or otherwise for the use of HCl in the aq. ext. in K_2O detns. W. H. FRY.

Report on availability of potash. E. E. VANATTA. *J. Assoc. Off. Agr. Chem.* 1, 24–6(1915).—Manure in combination with soil decreases the amt. of water-sol. K_2O and the moistened mixt. seems to retain much more of the K_2O than does the dry mixt. Further study is recommended. W. H. FRY.

Report of committee on availability of phosphoric acid in basic slag. C. B. WILLIAMS. *J. Assoc. Off. Agr. Chem.* 1, 102–7(1915).—Source, fineness, and compn. of material, and directions for pot expts. are given. W. H. FRY.

Fermented molasses as source of nitrogenous and potassic fertilizers. A. AITA. *Italia agricola* 52, 54–7(1915).—Sugar beets yield an average of 4% molasses, containing 1.5% N and 5% K_2O. J. A. LECLERC.

Certain factors which influence the fertilizing effect of the slightly soluble phosphates. H. G. SÖDERBAUM. *Kgl. Landtbruks-Akad. Handlingar och Tidskrift* 54, 448–77(1915).—The influence of CaO upon the slightly sol. phosphates (*e. g.*, $Ca_3(PO_4)_2$, bone meal, etc.) was reported from the Kgl. Landtbruks-Akad. Feilds Nos. 75 and 78 in 1903. These expts. showed that whereas the addition of CaO to the readily sol. phosphates had no marked effect upon their ability to increase the crops, the addition of the CaO to the less sol. phosphates inhibited their action. Where the CaO in the soil is low, either type of phosphate (as bone meal or superphosphate) may be used to advantage, but with a high CaO content the insol. phosphates give no desirable results. The expts. now published are a continuation of the series on the influence of N and Mg. The plants used were oats, barley, rye, and wheat; they were grown in pots of soil poor in both P and N. The phosphates used were superphosphate, Thomas slag, Ca_2HPO_4, bone meal, Algier phosphate and apatite. N was added as Chili saltpeter, $(NH_4)_2SO_4$ and org. N. With superphosphates the $(NH_4)_2SO_4$ gave a larger yield than the $NaNO_3$ but with $Ca_3(PO_4)_2$ this was reversed. These results varied with the plants, wheat being more sensitive than the others to these influences. In using Ca_2HPO_4 there is little choice between the two N compounds. With the less sol. types of phosphates, on the other hand, $(NH_4)_2SO_4$ proved superior to $NaNO_3$. Similar results are recorded for org. N; barley, however, is an exception to the above in that NH_3 and org. N always give a poorer crop than $NaNO_3$, regardless of the type of phosphate with which they are administered. When $MgSO_4$ was added with the readily sol. forms of phosphates to the pots the effect on the growth of the plants due to the Mg was slight if any at all and was independent of the forms of N used. The tendency which could be noted was adverse. On the other hand the addition of $MgCO_3$ together with $(NH_4)_2SO_4$ to such phosphates was followed by a distinctly increased yield. With the insol. phosphates $MgSO_4$ gave slight and conflicting results, and $MgCO_3$ varied with the plant, increasing the yield of rye and wheat and slightly decreasing that of barley and oats. A. R. ROSE.

The comparative value of different sources of phosphorus. BURT L. HARTWELL AND S. C. DAMON. Rhode Island Agr. Expt. Sta., *Bull.* 163, 515–60(1915).—This bull. contains the details of the unpublished results and a summary of the published results secured in all the field expts. with diff. sources of P conducted at this station previous to 1914. In a 6-year comparison of Chincha and Lobos guanos, ground bone and dissolved phosphate rock the yield of crops from plots treated with these substances was 8747, 9094 and 8420 lbs., resp. In Expt. II Thomas slag phosphate, Lobos guano, ground bone and dissolved phosphate rock were compared for 7 years on an equal P basis in the presence of liberal amts. of N and K, with the hope that the natural supply of P would prove so deficient that this element would control the growth. No definite conclusions can be drawn from this expt. Twenty yrs. were devoted to Expt. III for the purpose of detg. the relative availability of equal amts. of P in 9 different phosphates applied during the first half of the expt. with liberal amts. of $NaNO_3$ and KCl to limed

Digitized by Google

and unlimed land. During the last half only N and K were applied in order that the after-effects of the different sources of P might be studied. On the basis of equal amts. of P on the plots, the most available P in both limed and unlimed soil was apparently that in Thomas slag phosphate, ground bone and dissolved bone. Dissolved boneblack and dissolved phosphate rock ranked next and were considerably superior to raw phosphate rock. The after-effects of the phosphates are striking and show the importance of continued tenure of the land. They left the rank of the different phosphates practically unchanged in case of the unlimed plots, the main change with the limed plots being that the dissolved boneblack was placed among those of first rank.

The effect of green manuring on soil nitrates under greenhouse conditions. HARRY H. HILL. Va. Agr. Expt. Sta., *Tech. Bull.* 6, 121–53(1915).—*Conclusions:* Organic matter, as blue-grass, clover and alfalfa, when turned under in the soil, appears to pass over into nitrates. This is more marked in sterilized than in unsterilized soil. The total number of bacteria in soils treated with green manures was much greater than in those soils receiving no green manure treatment. Legumes gave in most cases the higher bacterial count. Pure cellulose in the form of Swedish filter paper caused a depression in the number of bacteria and in plant growth. The rate of nitrate formation was greatly improved by the presence of green manures. Paper in each soil type caused a depression in nitrate formation. In every case plant growth was benefited by the addition of green manures. Paper had a pronounced effect on plant growth and was the cause of the yellow appearance given to the plants. There was a smaller amt. of N in plants grown in pots treated with paper than in those grown on untreated soil. Soils vary in their power to accumulate N at different times. A bibliography of 27 titles is given.
R. C. ROARK.

A study of Colorado wheat. W. P. HEADDEN. Colorado Agr. Exp. Sta., *Bull.* 208, I, pp. 48(1915).—This investigation deals with the compn. of Colorado wheat, "more particularly with those factors which establish its quality on characteristics." Analyses of soils are given (soil and subsoil), using different acid solvents. The NO_3 content was usually detd. with a Zn-Cu couple. Nitrates were also detd. in the fallowed section. Total N detns. are included. Variations of total and nitric N are brought out as well as variations of P_2O_5 and K_2O. Among other points considered were nitrogenous compds. in the developing plants, ratios of leaves, stems and heads, the dry matter in the plants, the effects of fertilizers as indicated by the N content of the plant and the ash constituents of the plants.

Report on insecticides. S. D. AVERITT. *J. Assoc. Off. Agr. Chem.* 1, 59–76 (1915).—Data are given and arguments brought forward showing the superiority of the I method over the $ZnCl_2$ method for the analysis of lime-S solns. Recommendations as to future work and as to changes in present methods are made.
W. H. FRY.

A comparison of the iodine titration and zinc chloride methods for the analysis of lime-sulfur solutions. R. C. ROARK. *J. Assoc. Off. Agr. Chem.* 1, 76–94(1915). —Lime-S is a complex soln. containing many compds. In the $ZnCl_2$ method all compds. that can interfere with titration of thiosulfate S are pptd. by addition of ammoniacal $ZnCl_2$ soln. or are rendered inocuous by neutralization of the filtrate with HCl. In the I titration method such compds. will markedly affect results obtained in the titrations. A theory is advanced explaining the discrepancies observed in the detd. and calcd. values for lime.
W. H. FRY.

A short method for the analysis of a lime-sulfur solution. S. D. AVERITT. *J. Assoc. Off. Agr. Chem.* 1, 95–6(1915).—Wash a 7-cm. ashless filter several times with suction, dry thoroughly in the water oven, put in a weighing bottle and weigh at once.

Digitized by Google

Filter the sulfide S on this weighed filter, washing thoroughly, drying and weighing in the bottle as before. The difference in wt. is the sulfide S. During the first drying of the filter the titrations with I are made, 2 or 3 drops of dil. HCl added and the soln. placed on the water bath for a few min. (do not heat above 40° or 50°). When S collects, it is ready to be filtered. To the filtrate and one washing (the whole should not be over 40 or 50 cc.), add 2.5 cc. of 10% $BaCl_2$ soln., shaking thoroughly. Compare turbidity with a standard soln. of the same vol. W. H. FRY.

A report of chemical investigations on the lime-sulfur spray. H. V. TARTAR. Oregon Agr. Expt. Sta., *Res. Bull.* 3(1914); see *C. A.* 8, 1715, 2214, 2772. R. C. R.

16. FERMENTED AND DISTILLED LIQUORS.

ROBERT WAHL.

Wines with slightly alkaline ash. A study of the composition of the ash of pure and adulterated wines. W. J. BARAGIOLA AND C. GODET. *Z. Nahr.-Genussm.* 30, 67–100(1915).—The alkalinity of the ash of ordinary wines expressed as cc. *N* acid per g. of ash varies normally between 7 and 13. Twenty instances are given in which the alkalinity of pure wine of known history was found to fall below 7, the max. and minimum in these cases being 2.4 and 5.9, resp. These wines without exception had an unusually high P_2O_5 content (35 to 85 mg. per 100 cc.), the abnormal results being attributed to this cause. For this reason B. and G. point out the necessity of detg. the compn. of the ash when low alkalinities are found. Four cases are also given in which low alka-

Digitized by Google

linity of the ash indicated adulteration, as shown by an analysis of the ash. Two of these wines were shown to contain added H_2SO_4, its presence being indicated by the high acidity of the wine, the amt. of SO_4 detd. directly in the wine, and by the SO_4 content of the ash. In such cases the amt. of SO_4 found in the ash is usually lower than that detd. directly in the wine owing to loss of SO_4 during ignition. In the case of high SO_4 caused by plastering this does not occur because only secondary sulfates are present. Another wine was shown to contain added NaCl, the sophistication being indicated by low alkalinity (2.9) and by the unusual amt. of Na and Cl in the ash. The Cl content (0.34 g. per l.) did not exceed the max. permitted by the Swiss standards, but when considered in connection with the alkalinity and the Na content of the ash it established the nature of the adulteration. In the same manner a Spanish wine was shown to contain added phosphates and NaCl. Analyses of wine ash are usually subject to many sources of error, chief of which is the tendency of $BaSO_4$ to carry down phosphates during the detn. of SO_4. To avoid this as much as possible it is recommended that the soln. be made strongly acid with HCl and then dild. to such an extent that the acidity may not interfere with complete pptn. of $BaSO_4$. The authors regard azolitmin paper as the best indicator for the detn. of alkalinity of wine ash, the presence of phosphates rendering phenolph. highly unsuitable, though it is prescribed by the Swiss official method. They also recommend the Farnsteiner method (*C. A.* 1, 1590) for detg. alkalinity, since it is founded upon rational scientific principles, and they show the desirability of applying it uniformly to all food products. An extensive bibliography is given. A. F. Seeker.

Use of a colorimeter with formol-titrations. Ludwig Adler. Munich. *Z. ges. Brau.* 38, 241–3, 251–2(1915).—Lüers' acidimeter (cf. *C. A.* 8, 3613) was slightly modified by Adler, the hollow prisms being replaced by hollow circular cylinders. The stable dye-soln. supplied with the app. matches exactly the color produced at the end point of a formol titration (characterized by $p_H = 9.1$). This soln. dild. with 10 vols. 96% alc. matches the color obtained in neutralizing a colorless soln. of amino acids previous to the addition of formol. A. proposes always to det. the preëxisting and the total formol-titratable N in malt (cf. *C. A.* 8, 2025) and points out that by the use of this colorimeter it is possible for each analyst to definitely fix stage 1, thus making the data obtained in different laboratories comparable. L. W. Haas.

The mycology and chemistry of the alcohol question. Olav Sopp. *Tidskrift Kemi. Farm. Terapi* 12(1915).—An assay continued throughout this vol. of the journal. The article is based on personal observations and the literature on the subject matter. The compn. of some brands of liquors obtained in the Norwegian market are given and discussed. A. R. Rose.

Manufacture of rum. E. Kayser. *Rev. gén. sci.* 26, 465–8(1915); cf. *C. A.* 9, 1658.—A review. L. W. Haas.

Ferments of rum. E. Kayser. *Compt. rend.* 161, 181–4(1915).—The compn. of rum essentially depends upon the fermentation organisms employed (*C. A.* 9, 1658). An especially important role is played by bottom yeasts (I), *Schizosaccharomyces* (II) and top yeasts (III). The volatile acids produced (which compete in the production of esters and flavor) vary in nature and quantity not only with the culture medium, but also especially with the type of yeast; they are affected by all factors influencing these organisms, *e. g.*, abundance or shortage of air, compn. and reaction of medium, temp., etc. Fernbach's statement, that the more acids are produced the less acid the original liquid is, was confirmed for rum yeasts with regard to volatile acids. The volatile acids produced in rums are formic, acetic and butyric acids. A mixt. of the volatile acids previously converted into their salts gave, when treated with H_2SO_4 and EtOH, a characteristic rum odor, variable with the type of yeast employed. Yeasts

Digitized by Google

of type I furnished a more delicious odor, those of types II and III odors resembling arrack. If infusions of malt-dust with 10% sugar are fermented in portions with different acidities (neutral, 0.5 and 1.5% tartaric acid) the quantity of formic acid is augmented progressively with the acidity; yeasts II and III produce the max. quantity. The proportion of butyric acid was highest in neutral media. The yeast crop is decidedly lower in acid media. The proportions of butyric and acetic acids vary even with varieties of the same type of yeast, and with the nature of the medium. If to a sugar cane wort is added the same quantity of N in the form of peptone, $(NH_4)_2SO_4$ or asparagine, for yeasts of types I and II there results: with mineral N formation of almost pure acetic acid, with amino N an appreciable augmentation of formic acid, with peptone only slightly diminished proportions of butyric acid. Both types of yeast produce more butyric acid at 25° than at 35°. L. W. HAAS.

Studies on the hydrant water of Munich. ALBERT REICHARD. *Z. ges. Brau.* **38**, 169–74, 179–82, 187–90, 193–6, 201–3, 209–12, 217–20, 226–9, 233–6(1915).—The exhaustive exptl. work is a continuation of R.'s earlier investigations on Munich's water (*C. A.* **8**, 984) and may be summarized as follows: The pptn. of $CaCO_3$ starts at room temp. and increases with rizing temp. The formation of $CaCO_3$ at any temp. proceeds in the following stages: (1) Dissociation of $Ca(HCO_3)_2$ and expelling of HCO_3^-, (2) hydrolysis of $Ca(HCO_3)_2$ and formation of OH ions (primary alkalinity), (3) formation of CO_3^{--} and subsequently of $CaCO_3$, resulting in a decrease or complete disappearance of the primary alkalinity. The $CaCO_3$, is formed in a colloidal state and may be redissolved at higher temps. if for any reason its coagulation is prevented; this is associated with dissociation and hydrolysis. The formation and pptn. of $CaCO_3$ are favored by (1) artificial increase of OH^- ions (addition of lime water, alkalies), (2) sol. Ca salts (which cause the $CaCO_3$ to become coarser), (3) by the rapid formation of $CaCO_3$ particles, (4) by agitation. Retarding factors are (1) unlike ionic salts (Mg salts more than Na salts and sulfates more than chlorides and nitrates), (2) decrease of concn. of $Ca(HCO_3)_2$ (either by partial pptn. or interaction of $Ca(HCO_3)_2$ with other salts to form undissociated salts), (3) colloidal stabilizing substances, org. and inorg. Towards the end of the $CaCO_3$ pptn. the alk. reaction of $MgCO_3$ begins to be observed. As to alkalinity, the following was established: (1) An increase is caused by continued heating, especially after an intermediate filtration or decantation; (2) a permanent increase is effected by an addition of $MgSO_4$ (less so by $Mg(NO_3)_2$ or $MgCl_2$); (3) a temporary increase during heating is caused by Na salts; (4) a decrease or annihilation is effected by $CaSO_4$; (5) an increase is also caused by protective colloids for $CaCO_3$, unless $CaCl_2$ is counteracting or modifying; (6) formation of new OH^- ions occurs after each neutralization of the latter ("puffer" effect). With regard to decarbonating, the strongest checks were exerted by colloids, which may be org. or inorg. (water-sol. Ba salts in great diln.); in this case the heated water may remain almost clear but possesses a strongly alk. reaction. $MgCO_3$ in greater concn. attains, on heating, colloidal properties and may then influence the solubility of $CaCO_3$, as is shown by the very slow pptn. of $CaCO_3$ on addition of Mg salts. Other factors exerting a retarding influence on decarbonating are Na salts in a less degree, Mg salts in a higher degree, interruption of heating, diln. of $Ca(HCO_3)_2$ and resting of liquid. Factors favoring decarbonating are Ca salts, cane sugar, water-sol. Ba salts in higher concn. and agitation. L. W. HAAS.

Polarimetric starch determination in brewers' grains (and barley). F. M. WIENINGER. *Z. ges. Brau.* **38**, 257–60, 265–7, 273–4, 281–3, 289–91(1915).—The action of phosphotungstic acid and $ZnSO_4$ on dissolved starch was studied and the following procedures for the detn. of starch adopted: *For grains.* These are to be thoroughly washed and dried. Introduce 2.5 g. of the finely ground grains into a 100 cc. measuring

Digitized by Google

flask with wide neck and add 2.5 cc. 1% $ZnSO_4$ soln. After the grains are thoroughly soaked, add 25 cc. H_2SO_4 (d. 1.4) from a buret under continued shaking, and place the flask in a water bath at 22°, occasionally mixing the content of the flask. After 20 min. add 25 cc. H_2SO_4 (d. 1.4) and 10 cc. 25% $ZnSO_4$ (the latter to ppt. a levo-rotatory substance), mix and fill the flask to the mark with H_2SO_4 (d. 1.3). Mix well the contents of the flask and filter through a folded filter resting on a small plain filter. Filtration is interrupted after 30 min. Allow the turbid filtrate (not to be poured back) to stand for 4–5 hrs. and then pour into a 300 cc. Erlenmeyer contg. 6–7 g. purest $BaSO_4$. After mixing well filter through a double filter. Pour the filtrate back until it runs perfectly clear. If worked properly, the filtrate is pale yellow, brilliant, easy to polarize, remains clear for 12 hrs. and does not change its power of rotation. The rotation of this liquid gives the total rotation. To det. the permanent rotation (due to non-starchy substances) introduce 2.5 g. of grains into a 100 cc. flask together with 25 cc. H_2SO_4 (d. 1.4). Keep the flask at 22° for 20 min., occasionally shaking. Then add 25 cc. H_2SO_4 (d. 1.4) and 20 cc. 8% phosphotungstic acid, fill up to the mark with H_2SO_4 (d.1.3), mix and filter perfectly clear. Filtration proceeds quickly and the filtrate is nearly colorless and ready to be polarized. % starch = (total — permanent rotation) × 10.16. The factor 10.16 refers to a 2.5 g. sample and a 20 mm. tube. (10.16 = (40 × 100)/-(2 × 196.8)). *For barley.* To det. the total rotation, moisten 2.5 g. barley meal in a 100 cc. flask with 5 cc. 1% $ZnSO_4$ soln., then add 50 cc. H_2SO_4 (d. 1.4) and allow to stand at 22° for 1 hr., shaking every 10 min. After adding 20 cc. 25% $ZnSO_4$, fill up to mark with H_2SO_4 (d. 1.3), etc. Filtration proceeds rapidly and after mixing with 6–7 g. $BaSO_4$, the liquid may at once be filtered clear and polarized. The filtrate is pale yellow and does not change its rotatory power within 4 hrs. For the detn. of the permanent rotation, only 1 g. of substance is employed and 25 cc. 8% phosphotungstic acid are to be used; the time of digestion is 1 hr. By multiplication with 2.5 the observed permanent rotation is calcd. to a 2.5 g. sample, and the starch content is then calcd. as with grains. The method is claimed to be very accurate and to give results in close agreement with the method of Lintner and Schwarcz (*C. A.* 7, 3637) with regard to the magnitude of polarization; a small difference in the final result is due to the use of the factor 10.1 by the latter. L. W. Haas.

The nitrogenous substances of yeast. Jakob Meisenheimer. *Wochschr. Brau.* 32, 325–6(1915).—To cleave the protein substances yeast was subjected to autolysis in presence of toluene. The amino acids formed were sepd. by Fischer's ester-method. Nearly all monoamino acids known to be cleavage products were found to occur in yeast protein: glycocoll, alanine, valine, leucine, proline, phenylalanine, aspartic and glutamic acids, tyrosine, tryptophan, and probably serine and cystine. Glucosamine, so often looked for in vain, was isolated from the products of hydrolysis by HCl of the cell residues not attacked by autodigestion. There is also probably an aminobutyric acid present. Nitrogen in yeast protein is distributed as follows: ammonia N = 11% alloxur-bases (nuclein bases) N = 7%, arginine-hystidine N = 22%, lysine-choline N = 4%, monoamino-acid N = 56%. L. W. Haas.

Experiments on the enrichment of crude alcohol with higher alcohols by the vitality of yeast. G. Heinzelmann and Joh. Dehnicke. *Z. Spiritusind.* 38, 316, 328, 347(1915).—The types of yeast examd. show an equal capacity for producing higher alcs. The production of higher alcs. is least in potato mashes, higher in molasses mashes and highest in grain and corn mashes. Wild yeasts (fruit yeasts) differ much with regard to the formation of higher alcs. With little pitching yeast more higher alcs. are obtained than with much yeast. A higher sugar content of the mashes decreases the amt. of higher alcs. The yield of these alcs. is higher at the normal fermentation temp. than at any other temp. Aeration has no influence. Only in sugar solns.,

Digitized by Google

to which leucine had been added, aeration increases the yield of higher alcs. The nitrogenous yeast food in the mashes is of the utmost influence on the production of higher alcs. Asparagine, NH_4 salts, autolyzed yeast and ext. of malt-culms added to the mash effect a diminution of the higher alcs.; their production may even be almost completely inhibited by a sufficient quantity of asparagine or $(NH_4)_2SO_4$. An increase may be attained by adding leucine to the mashes, provided they contain but little nitrogenous yeast food more readily assimilable than leucine. Yeast stimulants in general effect a decrease in the production of higher alcs. L. W. Haas.

Yeast protein. Carl Neuberg. Kaiser Wilhelm Institut, Berlin. *Wochschr. Brau.* 32, 317–20(1915).—The maceration juice obtained according to Lebedev from dried yeast was heated on a water bath to coagulate the dissolved protein, the pptd. protein filtered off, washed with water, dehydrated by abs. alc., and then disintegrated in a mortar in the presence of alc. and ether. Yeast protein was finally obtained as a white powder, which gave all the common protein reactions. The N, S and P content of the proteins of different yeasts is very similar; for one was found: N 13.15, S 0.93, P 0.61%. A greater portion of the isolated protein was hydrolyzed by fuming HCl according to Fischer, the amino acids esterified and the esters fractionated. It was established beyond doubt that alanine is among the radicals building up the yeast protein molecule. Tryptophan is also present to the extent of about 0.2%. L. W. H.

Kilning of grain. Karl Windisch. Hohenheim. *Wochschr. Brau.* 32, 309–12 (1915).—Grain is suitable for long storage if its moisture content is between 12 and 13%. Excessive moisture is best reduced by drying the grain on kilns as used in the malthouses. The layer of grain on the kiln may be made 15 to 20 cm. thick according to the draft available. The kilning temp. should not exceed 48°; with grains for milling purposes 55° is permissible. L. W. Haas.

Aluminium paint as coating for wooden fermenters. Rob. Heuss. *Z. ges. Brau.* 38, 177–9, 185–7(1915).—Al paint is without influence on the course of fermentation, is not attacked by the fermenting wort and does not impart any taste to wort and to a 4% alc. The coating is attacked by nearly all common disinfectants in the usual concn., CH_2O being an exception, and is little resistant to mechanical cleaning procedures. L. W. Haas.

Characteristics of the barleys of 1915. Franz Koritschoner. Vienna. *Brau.-Malzind.* 16, 198–201(1915); cf. *C. A.* 9, 350.—Tabulation of analyses of 60 barleys of different provenience with regard to moisture, hl.-wt., assortment as to size, 1000 berry-wt., protein, N per berry, yield of ext., and germinating energy and capacity. L. W. Haas.

Experiences with "Regenerite." Robert Heuss. *Z. ges. Brau.* 38, 249–51 (1915).—H. records favorable results with "Regenerite," if added to pitch in not too large quantities (not exceeding 10%). L. W. Haas.

Ionization of the gases produced during fermentation (Potter) 2. Utilization of total brewery waste for feeding purposes (Ulrich) 12.

U. S., 1,154,989, Sept. 28. B. Hehle. **Preparing grain for brewing.** The husks of the grain are opened longitudinally to expose the mealy contents by forming a filter-bed of the grain and passing sparging liquid, *e. g.*, H_2O, through it at a temp. of 69–72°.

U. S., 1,156,448, Oct. 12. R. Wahl. **Salts for "burtonizing" brewing waters** containing principally $CaSO_4$ and NaCl, are prepared by melting cryst. Na_2SO_4, mixing with $CaCl_2$ and sepg. the excess of H_2O from the pasty mass formed.

17. PHARMACEUTICAL CHEMISTRY.

M. I. WILBERT.

Diogenal, a new sedative and hypnotic. F. STREBLOW. *Deut. med. Wochschr.* 41, 278(1915).—Diogenal (Merck) has the formula $C_{11}H_{16}O_2N_2Br_2$. It is a dibromopropyldiethylbarbituric acid. It is locally indifferent and 4 times less toxic than veronal (diethylbarbituric acid). As sedative it is recommended in doses of 0.5–1.0 g. 3 times a day, as hypnotic in doses of 1 g. S. AMBERG.

Treatment of chronic heart and kidney diseases with "Theacylon." A. HOFFMANN. *Münch. med. Wochschr.* 62, 1108–10(1915).—"Theacylon" is acetylsalicyltheobromine and a very good diuretic in doses of 1 to 4 g. per day. S. AMBERG.

Iodometric estimation of quinine. ERW. RICHTER. *Apoth. Ztg.* 30, 254–5(1915).—The article deals with a modified form of R.'s method for estg. quinine by means of picric acid (cf. *C. A.* 7, 677), involving the use of a soln. of KI + KIO_3 in connection with the titration of the alc. acid filtrate from the quinine-picric acid compd. This procedure is stated to be superior to the one involving the use of hematoxylin as indicator. W. O. E.

Applied plant microchemistry. XI. Detection of baptisin in Baptisia tinctoria (root). O. TUNMANN. *Apoth. Ztg.* 30, 272–4(1915); cf. *C. A.* 9, 1660. W. O. E.

Apparatus for sterilizing and filling ampoules in the drug store. C. STICK. *Apoth. Ztg.* 30, 286–7(1915).—A description of several practical appliances for accomplishing the object in question together with information relative to sources of supply. W. O. E.

Determination of nicotine in tobacco and tobacco preparations. H. B. RASMUSSEN. *Chem. Ztg.* 39, 25(1915).—Silicotungstic acid is used as the alkaloid precipitant, yielding the compd. $2C_{10}H_{14}N_2.2H_2O.12W_2SiO_2 + 5H_2O$, which on drying

Digitized by Google

at 120° loses its H_2O of crystn. Tobacco or its prepns. are first treated with a 20% NaOH soln., then exhausted with a mixt. of Et_2O and petr. ether, whereby all the nicotine is taken up by the solvent mixt., from which the alkaloid is later sepd. by shaking with dil. HCl and pptd. with silicotungstic acid. W. O. E.

Oil of Pistacia lentiscus. E. SERNAGIOTTO AND NERINA VITA. Bologna. *Ann. chim. applicata* 4, 92–3(1915).—Sepd. from the volatile portion by distg. in a current of steam, the oil has the following consts.: d_{15} 0.9188, n_D^{14} 66.00 (Zeiss butyro refractometer), acid no. 15.92, sapon. no. 165.58, sapon. no. after acetylization 203.03, Hehner no. 94.824, Maumené no. 46.2, I no. 83.61, I no. of acids 85.96. Palmitic and oleic acids were sepd. and identified. The volatile portion, amounting to about 0.5%, had a terpene odor, d_{15} 0.8654, $[\alpha]_D$ + 0, b. 165°, Br number 285.4. S. LEVY.

Tasteless quinine derivatives which are employed in therapeutics. VIRGINIO LUCCHINI. Milan. *Boll. chim. farm.* 53, 344–58(1914).—L. has reviewed the most important portion of the literature which relates to tasteless derivs. of quinine, especial reference being made to aristoquinine, insipin, quinaphenin, rheumatin, euquinine and saloquinine. H. S. PAINE.

Extraction of stachydrine. N. T. DELEANO. Bucharest. *Bull. soc. stiin. Bucharest* 23, 39–42; *Chem. Zentr.* 1914, II, 647–8.—Extn. of the base with an alc. $HgCl_2$ soln. may be substituted for the phosphotungstic acid method for the purpose of obtaining choline, betaine and especially stachydrine, $[\alpha]_D^{18}$ —26.2°, decreasing to —9.2° or —9.3° after a period of contact with bases or acids; the base is completely racemized by boiling with concd. alkali. H. S. PAINE.

Adulteration and its detection in ethereal oils. O. WARD. *Seifensieder-Ztg.* 42, 743–4, 765–6(1915).—Description of known methods for the examn. of anise, bergamont, clove, neroli, orange, peppermint, rose, cassia and citron oils. E. SCHERUBEL.

Preparation of aristol. ANON. *Pharmazevtizeski Journal* 1915, 153; *J. pharm. chim.* 12, 164(1915).—Take thymol 15.0, NaOH 20.0, I 6.35, KI 8.3. Dissolve the thymol in 250 cc. of H_2O, add NaOH. Also make soln. of I and KI in 250 cc. of H_2O; mix the 2 solns. A ppt. forms which at once redissolves. Into the opalescent green liquid pour, in small amts. as long as a ppt. forms, a concd. NaCl soln. Filter, collect the ppt., dry in the dark below 50°. Thymol must not contain thymene which would cause formation of CHI_3. S. WALDBOTT.

Note on sirup of tolu, British Pharmacopeia 1914. F. GOLDBY. *Pharm. J.* 95, 300–1(1915).—Instead of 400 cc., as directed by the Brit. Pharm., 350 cc. of aq. tolu ext. should be mixed with 660 g. of sugar so as not to exceed the total limit of 1000 g. set by the pharmacopeia. S. WALDBOTT.

Merzalin. MERZ & Co. Frankfurt a/M. *Schweiz. Apoth. Ztg.* 53, 465–6(1915); cf. *C. A.* 9, 2691, and *Pharm. Ztg.* No. 50(1915).—A defence of the use of talcum as ointment base. Expert testimony is quoted. S. WALDBOTT.

"Digosid," a new preparation from digitalis. F. WRATSCHKO. *Z. allg. Oest. Apoth. Ver.* 1915, 215; *Pharm. J.* 95, 199(1915).—Excluding enzymic action and working in neutral soln. at low temp., W. has prepd. "digosid," a white amorphous powder, sol. in $CHCl_3$, MeOH, EtOH, amyl alc. and C_5H_5. It dissolves with difficulty in Et_2O, CCl_4, H_2O (1:850) and benzine, and is almost insol. in petr. ether. Like gitalin, it is decompd. by boiling with EtOH, but unlike gitalin, it resists boiling with H_2O. It gives the test for gitalin and digitoxin. The 1:2000 soln. in physiol. NaCl soln. has the taste of a digitalis infusion. S. WALDBOTT.

The cause of discoloration of suprarenine hydrochloride. J. L. ELPHINSTONE. Aberdeen. *Dental Cosmos* 57, 656–58(1915).—The discoloration of suprarenine-HCl is due to atmospheric ammonia. JOSEPH S. HEPBURN.

Vegetaline as basis for surgical liquid soaps. *J. pharm. chim.* 12, 81–5, 113–23 (1915); *Pharm. J.* 95, 360(1915).—Since the warm solns. of Na soaps form gels upon cooling, even in diln. of 1:400, only K soaps can be used, best made from vegetaline, a com. form of coconut oil. This soap is of definite compn., very sol., colorless and very foamy. Its prepn. is quantitative and requires the following steps: (1) Detn. of sapon. no. of vegetaline: 248.4. (2) Prepn. of KOH of definite strength, *e. g.*, 336 g. per l. (d. 1.270). Then 100 g. vegetaline require 24.84 g. KOH or 73.9 cc. (d. 1.270). As glycerol is not removed, 1 kg. vegetaline will yield 1.250 kg. dry soap, or 2.5 kg. of soft soap with 50% H_2O. (3) Prepn. of a small amt. of a 50% K soap, *e. g.*, 250 g. by alcoholic sapon., to aid in (4) prepn. of K soap by non-alcoholic sapon. Heat 50 g. of soap from (3) with 50 g. H_2O on water bath in a 2 l. Ni capsule for 10 min. Then add 369.5 cc. KOH, (d. 1.270), warm to 85–90°, add 500 g. vegetaline, stir continuously with Fe spatula. The mass gradually thickens, and after 8–10 min. becomes stiff. Cut the mass, add 300 cc. H_2O, cover with plate and heat 1 hr. longer, then cool. Bring with H_2O to 1250 g., crush the lumps, set aside 48 hrs. A homogeneous mass results, completely sol. in H_2O to a very conc. soln. (*e. g.*, as much as 750 g. of 50% soap in 1 l.), nearly as mobile as H_2O. For liquid soaps, 250 g. per l. may be used. The foaming qualities are tested by the persistence of the foam, *i. e.*, by the decrease of its thickness in mm. with time. With due precautions reliable data are obtained.

S. WALDBOTT.

A history of antiseptics. "CHEMICUS." *Pharm. J.* 95, 324–5(1915).—The early history since 1751 is briefly recorded. Lister's work and his coöperation with Martindale (1886) in evolving $Hg(CN)_2.Zn(CN)_2$ as an antiseptic is mentioned, also its prepn. by Dunstan (1892). Attention is called to the discovery, prompted by war needs, of an efficient and safe antiseptic by Lorrain Smith and coworkers (*Brit. Med. J.* July 24, 1915). Two preps. are described: (1) *Eupad*, a solid prepared by rubbing together equal amts. of dry $CaOCl_2$ and powdered H_3BO_3; (2) *Eusol*, a liquid, prepared by adding 1 l. of H_2O to 25 g. of the solid, filtering after several hrs. The soln. contains HClO 0.54%, Ca biborate 1.28, $CaCl_2$ 0.17%. This prep. closely resembles that of Carrel and Dakin (*Times*, Aug. 6, 1915).

S. WALDBOTT.

Strength of picric acid as an antiseptic. H. L. TIDY. *Lancet* 1915, 604; *Pharm. J.* 95, 397(1915).—Picric acid has been used with success for the sterilization of the skin before operations in 2–3% solns. in EtOH. Expts. have shown that the Rideal-Walker carbolic acid coeff. of picric acid is exactly 6; a 0.165% soln. of picric acid has the same bactericidal powers towards 24-hr. broth cultures of typhoid bacteria as has the standard 1% soln. of carbolic acid.

S. WALDBOTT.

Notes on colchicum seeds. J. C. UMNEY. *Pharm. J.* 95, 393(1915).—Variations of 1.7–4.1 g. extractive matter per 100 cc. of tincture of colchicum, due to reducing sugar surrounding the seeds, suggest possible adulteration with glucose. Seeds removed from ripened colchicum by E. M. Holmes yielded to 70% EtOH 5.38% reducing sugar. Again, U. in 1905 found that seeds from undehisced capsules in wet season gave as high as 6.7% saccharine matter, in dry season only 1.75–3.35%. Thus the amt. of sugar naturally present in seeds directly after removal from the pods was rather more than that present in com. seeds.

S. WALDBOTT.

Persian galbanum. PROSPER H. MARSDEN. *Pharm. J.* 95, 356–8(1915).—M received com. specimens, oddly packed in the hollow of umbelliferous stems, 21 cm. X 4 to 4.5 cm. Tears 0.5–1 cm. diam. were imbedded in a sticky mass. The odor was that of [illegible] taste bitter; [illegible]one test (*Brit. Pharm.* 1898). H_2O

Digitized by Google

7.36%, ash of resin 2.29%. HCl gave violet-red color after warming; $CHCl_3$ + KOH on heating gave brown color. 78.55% of the gum resin was sol. in cold EtOH. 5.93 g. gum resin extd. successively, yielded to petrol. spirit 0.25, Et_2O 2.875, MeOH 0.060, H_2O at 49° 0.340 g. Two mericarps were picked out from the specimen and compared microscopically with one from another specimen of com. galbanum, and with two herbarium specimens of *Ferula galbaniflua*. Boiss. and Buhse. Illustrations are given. It appears that the fruits found in liquid or solid galbanum now on the market are not those of *F. galbaniflua* (cf. J. Small, *C. A.* **7**, 2658). E. M. Holmes adds that it is probable but not absolutely certain that the fruits found in the gum resins are those of the plant yielding it. S. WALDBOTT.

Modifications of the formulas for ammoniacal silver nitrate, and iodized potassium iodide. F. RICHARD. *J. pharm. chim.* **12**, 161–4(1915).—In ammoniacal $AgNO_3$, Fr. Cod. 1908, the amt. of NH_4OH is exactly sufficient to dissolve the Ag_2O first pptd. When NH_3 is lost by evapn., the pptd. Ag_2O is liable to be mistaken for reduced Ag, *e. g.*, in testing for aldehydes. R. proposes to add to a 5% $AgNO_3$ soln. an equal vol. of NH_4OH (d. 0.925). Air-dried $AgNO_3$ may be used. In iodized KI of the Codex, the amt. of KI (2 g.) is insufficient to dissolve the I required (4 g.). By dilg. to 100 g., some of the dissolved I will be repptd. R. proposes the formula: I cryst. 40 g., KI 80 g., H_2O to make 1000 cc., not grams. Put the I and KI into a 1000 cc. flask, add 20 cc. H_2O, agitate for 2 hrs., complete to 1000 cc., mix. This manipulation allows the prepn. of massive doses of I in a small vol. for ointments, *e. g.*, I 500 g., KI 1000 g. (reducible even to 760 g.), H_2O first 250 g.; after 2 hrs. stirring, more H_2O to make 1000 cc. S. WALDBOTT.

Ger., 284,233, Oct. 19, 1913. KALLE & Co. **Mfg. derivatives of 2-phenylquinoline-4-carboxylic acid** by condensing *o*-, *m*-, or *p*-hydroxyacetophenone with isatin, or *m*- or *p*-hydroxybenzaldehyde with aniline and pyroracemic acid. The products are applied therapeutically.

Ger., 284,234, Dec. 17, 1913. K. H. SCHMITZ. **Mfg. gold-N-alkylhexamethylenetetraminehalocyanides** for application in the treatment of infectious diseases, by allowing free halogen to act on the double compds. of hexamethylenetetraminealkylcyanides and Au cyanides of the general formulas $C_6H_{12}N_4$.alkyl.CN.Au^{I}-CN and $C_6H_{12}.N_4$.alkyl.CN.$Au^{III}(CN)_2$, or by bringing into double decompn. the K-Au-Hl-cyanides of the comp. $KAu(CN)_2Hl_2$ and the salts of the hexamethylenetetraminealkylhydroxides.

Ger., 284,259, Dec. 5, 1913 and addition 284,260, Mar. 12, 1914. K. H. SCHMITZ. **Mfg. double compounds of the salts of hexamethylenetetraminealkylhydroxides and salts of heavy metals.** If the halogen, thiocyanogen, or cyanogen salts of heavy metals (Cu, Hg and Au), or the alkali double compds. of these metals with the specified acids are allowed to act upon salts of hexamethylenetetraminealkylhydroxides, valuable double compds. are obtained. Of these the Hg double salt is said to find ap-

Digitized by Google

plication as an antiluetic agent, while the complex Au and Cu compds. appear to be suitable for the treatment of tuberculosis. In an addition patent the method of prepg. the double salt is modified by acting on the aq. solns. of hexamethylenetetramine-alkylhalides with $AuCl_3$ soln., or on the aq. solns. of alkali salts of hydrogen halogen auric acids with hexamethylenetetramineakylhalides. The AuI_3 double compds. are especially suitable.

Ger., 284,319, Mar. 1, 1914. Kalle & Co., Akt.-Ges. **Mfg. stable preparations from organosols and fatty compounds.** The various colloids differ with respect to their permanency, *i. e.*, as to the ease with which their organosol or hydrosol character may be preserved. Also, when the stability is increased by a protecting colloid, such as wool fat in the case of organosols or Na protalbinate in the case of hydrosols, still not all organic colloids are equally stable in combination with such protecting colloids. By this process the stability of these organosols can be materially increased, and made almost perfectly permanent, if such a consistence be given to the fats serving as solvents that they are solid or practically solid at the ordinary temp. If a wool-fat organosol be dissolved in a fat or fat mixt. which liquefies at a gentle heat, the solvent, solidifying at the room temp. prevents the aggregation of the colloidal particles which are therefore fixed in the solid solvent, so that the organosol is rendered stable. By the combination of a solid fat with low I number, or of a fat reduced by catalytic hydrogenization to a zero I number, or even of solid glycerol esters produced synthetically, with an indifferent solvent, liquid at the ordinary temp., the prevention of catalytic oxidizing action of inorganic organosols (such as metal catalyzers) on the soln., and the permanent preservation of their organosol character are possible. The solid fats of low I number specified are, especially, the purified palm nut oil and pure coco fat (*e. g.*, palmin), and the indifferent solvents mentioned are capryl and caprin esters or ethers, as well as liquid or low-m. glycerides of purified fatty acids (*e. g.*, tributyrin). *E. g.*, 1 part of the organosol of $Pd(OH)_2$ (cf. 268,311, *C. A.* 8, 1488) with 20% Pd content, is dissolved with gentle warming in a mixt. of palmin (I number about 8) and caprin ether. The mass is then incorporated with the same mixt. to obtain the desired metal content, *e. g.*, 10 parts for a soln. with 2% Pd content. This soln. is perfectly stable, and the contained fat does not become rancid.

18. ACIDS, ALKALIES, SALTS AND SUNDRIES.

T. LYNTON BRIGGS.

The production of sulfuric acid and a proposed new method of manufacture. William W. Waggaman. U. S. Dept. Agr., *Bull.* 283, 39 pp.(1915).—Statistics and brief descriptions of existing methods of manuf. are given. A lead spiral is proposed as a substitute for chambers. Expts. show that by passing SO_2, air, and water vapor through a lead spiral in the presence of an adequate supply of N oxides, the formation of H_2SO_4 is practically complete, even when the gases are run at quite a rapid rate. The yield of acid was not so great with a glass as with a lead spiral, and comparative results indicate that the lead spiral has some influence on the oxidation of SO_2 to H_2SO_4. While $PbSO_4$ has some influence on the oxidation of SO_2, lead or lead oxide is a much more energetic catalytic agent. Classified tables of all American patents on the manuf. of H_2SO_4 give patent number, year, patentee, reagents used, app. employed, treatment, and object of app. or process. W. H. Fry.

Internal temperature of sulfur furnaces. Stefano Pagliani. Palermo. *Ann. chim. applicata* 4, 75–81(1915).—The literature contains little on this subject. The temp. in furnaces used for extg. S, as the Gill furnace, is supposed to be about 300°.

Digitized by Google

In furnaces used for producing SO_2, little is known as to the internal temp. By algebraic calcn., the theoretical temp. of combustion of S at const. vol. in just sufficient air is found to be 1990° and 2010°, using Langen's, and Langen and Pier's formulas, resp. At const. pressure under the same conditions, the temp. is calcd. to be 1100° and 1297°, using Mallard and Le Chatelier's, and Le Chatelier's formulas, resp. By graphic methods, the temp. of combustion at const. vol. is found to be 1620°, 2500°, and 1900°, using Mallard and Le Chatelier's, Pier's, and Le Chatelier's formulas, resp., and at const. pressure, 1605°, 1640°, 1650°, using Langen's, Holborn and Henning's, and Pier's formulas, resp. P. takes as an av. the value 1616° at const. press., and 2000° at const. vol. Considering, however, that in actual practice an excess of air is employed, P. deduces 900° as the theoretical temp. of combustion at const. pressure. He measured the temp. in a SO_2 furnace of 3 pans, of simple construction, in a H_2SO_4 plant, using a Le Chatelier thermo-elec. pyrometer, with Pt-Rh soldering, protected by a porcelain tube. The highest temp. found was 550°; the lowest could not have been less than 500°. In combustion furnaces for extg. S from the mineral, the temp. cannot be below 250°. P. concludes that the proper temp. should be 330–340°.
S. LEVY.

Fifty-first annual report on alkali, etc., works, by the chief inspector. Proceedings during the year 1914, pp. 126; *J. Soc. Chem. Ind.* **34**, 794–6.—Statistics of the alk., NH_3, Cu, H_2SO_4, HNO_3, HCl, Sn, Zn, cement, and fertilizer works registered in England, Wales, Ireland and Scotland are given, including comparisons with the 1913 output. Extensive notes on methods and improvements are interspersed, and the establishment of a properly staffed and equipped center for research and advice is suggested.
L. W. RIGGS.

The possibility of extracting potash salts through systematic leaching. J. FÜRER. *Kali* **9**, 168–70, 185–6, 200–3, 222–5, 237–9(1915).—Without offering new exptl. results, methods are proposed for manufacturing K salts by dissolving carnallite or other K material in place, and subjecting the resulting brine to fractional evapn. in vacuum pans.
W. B. HICKS.

Graphite contaminated in transit. O. BINDER. *Chem. Ztg.* **39**, 737(1915).—A cargo of Ceylon graphite contaminated with leaves, stems and grain was almost completely purified by stirring and pouring off. Or, it may be heated in retorts and the organic matter charred and similarly removed, or, for most purposes, left in.

Salt systems of oceanic salt deposits (D'ANS) 8. Ammonia as a by-product in sugar factories (DONATH) 28.

BLÜCHER, H.: **Auskunftsbuch für die chemische Industrie.** 9 Aufl. Leipzig: Veit & Co. 1459 ss. 18 M.

Digitized by Google

U. S., 1,154,640, Sept. 28. W. S. LANDIS. **Making ammonia from commercial calcium cyanamide.** The $CaCN_2$ is fed into a vessel of H_2O and stirred with it to form a slurry and the latter is intermittently treated with steam. During the intervals when steam is not supplied the reaction proceeds exothermically and the NH_3 formed is recovered before adding more steam.

U. S., 1,154,949, Sept. 28. F. VON OEFELE. **Compounds of vanadium and selenium** of the formulas V_2Se (white), V_2Se_2 (yellow), V_2Se_3 (red), V_2Se_4 (dark blue), V_2Se_5 (green), V_2Se_8, $KSeVO_2$, $(VO_2)SeH$ and KSeVO are formed by heating oxides of V and Se with C, SO_2 or HCl with or without alkalies.

U. S., 1,154,980, Sept. 28. A. EXBRAYAT. **Agglomerating ores, coal, etc.** The material is treated with an alk. soln. of fuchsine or gelose prepd. by treating seaweed with hot H_2O or steam and alkalies, mixed, molded into blocks, dried and then passed through a bath prepd. from seaweeds and soap soln., again dried and treated with a soln. of a sol. Al salt to form a H_2O-proofing of insol. Al soap. Small amts. of coal tar or pitch may be added to preserve the binder and an oxidizing salt, *e. g.*, $KClO_4$, to accelerate combustion.

U. S., 1,155,605, Oct. 5. H. K. MOORE. **Dry calcium hypochlorite** is made by chlorinating powdered $Ca(OH)_2$ on hollow shelves while cooling it to below the freezing point of H_2O by circulating brine through the shelves to prevent balling of the product and maintain it in powdered condition.

U. S., 1,155,045, Sept. 28. B. H. CRAM. **Apparatus for making oxygen.** Alkali metal manganate or permanganate is placed in retorts and alternately treated with steam and air at high temp. Material in one set of retorts is regenerated while O is produced by the action of steam in the other series.

U. S., 1,155,054, Sept. 28. P. H. FRANZ. **A felt friction material for use in brake bands, etc., is made by** shrinking felt fabric to the desired form, impregnating it with a soln. of shellac 30 lbs., resin 12 lbs., alc. 5 gals. and turpentine 3 gals., and drying.

U. S., 1,155,057, Sept. 28. M. GRUNZWEIG. **Expanding cork** particles (*e. g.*, for use in making "cork stone"). The particles are moistened and then introduced into a chamber in which they are suddenly heated to about 400° or lower temp., above 100°, while being agitated.

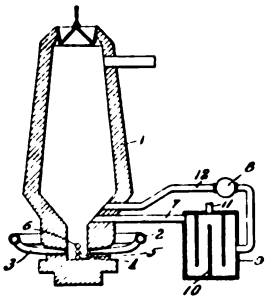
U. S., 1,155,840, Oct. 5. O. SERPEK. **Fixing nitrogen.** A mixt. of ferro-Al with C and bauxite is heated to 1200–1300° and treated with N. At this temp. the N combines with the ferro-Al and the heat of the exothermic reaction ensuing causes a rise in temp. to about 1800–1900° at which point fixation of N on the Al in the bauxite takes place.

U. S., 1,156,081, Oct. 12. G. HOPP. **Safety stair-treads, etc.,** are made by applying a mixt. of abrasive material with a phenolic condensation product to a metal base plate and hardening the mixt. by heat and pressure.

U. S., 1,156,107, Oct. 12. H. SPECKETER and G. MÜNCH. **A relatively pure anhydrous sodium hyposulfite** is produced by mixing aniline with aq. Na hyposulfite soln. and evapg. the soln. to dryness *in vacuo* while constantly agitating. The amt. of aniline used is preferably greater than that of the H_2O to be evapd. The aniline combines with any SO_2 formed during evapn. and the aniline sulfite and aniline are distd. from the hyposulfite.

U. S., 1,156,108, Oct. 12. A. C. SPENCER and K. P. MCELROY. **Making cyanides from producer gas and potash-bearing and other alkaliferous minerals.** An ignited charge of greensand, feldspar or camptonite rock and limestone, containing sufficient

Digitized by Google



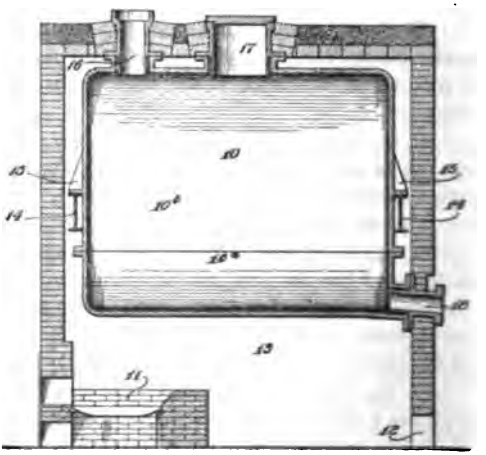
Fe so that some metallic Fe will be produced in the reaction, mixed with coke, is passed downwardly through the blast chamber *1* while air is forced through the pipes *2* and *3*. A current of vapors and gases is withdrawn from the high temp. zone through the pipe *7* and alkali cyanide is collected in the condensing chamber *9*. The residual gases are then returned to the reaction chamber. Molten Fe, slag and cyanide are drawn off through the openings *4*, *5*, and *6*, resp.

U. S., 1,156,388, Oct. 12. J. A. BRADBURN. **Potassium chloride** is obtained from natural saline waters such as Great Salt Lake water by refrigerating the water to cause crystn. of most of the Na_2SO_4, sepg. the crystals, adding $MgCl_2$ to the liquid and concg. it to effect crystn. of NaCl, removing the latter, cooling the liquor to cause sepn. of crude KCl crystals and sepg. and washing the latter to purify them.

U. S., 1,156,452, Oct. 12. L. H. BAEKELAND. **An insulating composition for impregnating electric coils,** immiscible with H_2O and having high dielec. properties, is prepared by mixing a solid initial condensation product of PhOH and CH_2O with about 30–40% its wt. of $C_{10}H_8$ or similar solid solvent and about 15–30% of a liquid solvent of high b. p., *e. g.*, $PhNO_2$, nitrotoluene, xylene, toluene or cumene.

U. S., 1,156,509, Oct. 12. E. WEINTRAUB and L. B. MILLER. **A microphone** is made with conductive granules of carbonized phenolic condensation product. The granules have a hardness of 6 or more on Mohs scale and give clearer enunciation and slower increase of resistance than the ordinary C granules.

U. S., 1,156,595, Oct. 12. W. E. FLETCHER. **A retort-furnace for distilling nitric acid.** The retort *10* with charging openings and outlets *16*, *17* and *18* is heated by hot combustion gases in the expansion chamber *13* passing from the fire-box *11* to a flue. The main heating, effecting deterioration of the retort, is at the bottom and the lower portion of the retort *10a* is made separable and renewable.



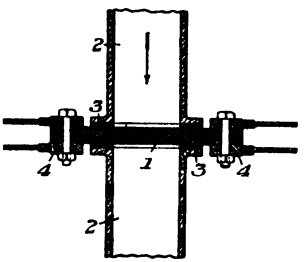
U. S., 1,156,662, Oct. 12. J. A. BRADBURN. **Preparing magnesia from dolomite.** Calcined dolomite is mixed with H_2O and the hydrated mixt. is combined with NaCl and NH_4Cl and the soln. subjected to distn. to obtain NH_3. The remaining liquor is treated with fresh calcined dolomite which effects pptn. of $Mg(OH)_2$ and sepn. of MgO from the dolomite. The $Mg(OH)_2$ and MgO are separately collected from the soln. by filtration and the $Mg(OH)_2$ is calcined.

U. S., 1,156,742, Oct. 12. G. G. BLARDONE, C. W. NICHOLS and F. BRUGUIERE. **A substitute for lampblack** is formed by charring and pulverizing rice hulls and chaff.

U. S., 1,157,253, Oct. 19. M. PIER. **Synthetic manufacture of ammonia** is effected by bringing together H and N, using a catalyst formed by rendering alk. a soln. of chloride of Ir or Rh and combining the resulting ppt. with a carrier of alk. earth oxide or carbonate.

Digitized by Google

U. S., 1,157,293, Oct. 19. C. J. BROCKBANK. **An apparatus for the catalytic manufacture of sulfuric acid,** or other products, is formed with a porous diaphragm *1* of compacted carborundum carrying Pt or other active catalyzer in its interstices. The diaphragm is heated electrically from the electrodes *4* and SO_2 and air are passed through it in the tube *2* at a temp. of 400–800°. Formation of H_2SO_4 is very rapid and complete.



U. S., 1,157,436, Oct. 19. H. SPENCE and T. J. I. CRAIG. **Solutions of sodium aluminate** are stabilized by the addition of about 0.5–1.5% of sugar, dextrin, starch, glycerol or saccharate, which inhibit the pptn. of $Al(OH)_3$. Cf. *C. A.* 9, 698.

U. S., 1,157,437, Oct. 19. A. C. SPENCER. **Recovery of potash from igneous rocks containing feldspathoid minerals** is effected by heating the finely divided rock, *e. g.*, leucite or nephelite syenite, to about the sintering temp. with CaO (with or without $CaCl_2$) in sufficient amt. to replace the K_2O and form di-Ca silicate but not sufficient to form tri-Ca silicate (after allowing for the formation of tri-Ca aluminate and tri-Ca ferrite); the heating is continued until the K_2O or KCl liberated is fumed off and recovered.

U. S., 1,157,455, Oct. 19. E. TAYLOR and F. P. BERGH. **Sulfuric acid** is made catalytically by injecting finely divided Fe oxide or other catalyst into a chamber containing a circulating mixt. of O and SO_2, controlling the temp. of the reaction by the introduction of air, and returning the catalyzer which seps. and injecting it again into a succeeding charge. Less catalyzer is necessary than when used as a stationary mass.

U. S., 1,157,493, Oct. 19. W. R. BARDSLEY. **Metallic dies for use in embossing** are formed by coating a metal surface, *e. g.*, Zn or Cu, with an albumin soln., drying in subdued light and applying an ink impression, then applying a fine, opaque powder, *e. g.*, dragon's blood, to the plate and exposing to the light for a sufficient time to render the sensitized soln. on the plate insol. in H_2O, washing with benzine, C_6H_6 or turpentine to remove the ink and powder from the plate, coating the surface with lithograph transfer ink, immersing in clear H_2O and washing off the portions which have not been exposed to light, then applying etching powder, heated until the powder melts and etching the plate.

U. S., 1,157,530, Oct. 19. F. D. HARPER. **Precipitated manganese dioxide** is pressed in a mold to give it about the same density as the native mineral MnO_2 and is then ground, to prepare it for use.

U. S., 1,157,662, Oct. 26. H. ARNOLD. **Fire-proof utensils** are made from a paste of rare earth oxide, *e. g.*, oxides of Zr, Th, Be or TiO_2, mixed with a small amt. of free mineral acid and a dil. colloidal soln. of hydroxide of the metal, the oxide of which is used in the paste. The mixt. is molded and then calcined, at 1600–2100°.

U. S., 1,157,668, Oct. 26. J. H. BONER. **Producing chromium salts from ores.** Chrome ironstone is heated with C or CO and Cl and the $FeCl_3$ is eliminated by volatilization.

U. S., 1,157,669, Oct. 26. C. BOSCH and W. WILD. **Hydrogen** is produced by removing part of the CO from water gas and treating the residual gas with steam under a pressure of about 60–600 lbs. per sq. in. while subjected to the action of a catalyzer. The H may immediately be used under its original pressure in making NH_3. More H is obtained and the reaction is accelerated by producing the H under high pressure. Cf. *C. A.* 9, 129.

U. S., 1,157,935, Oct. 26. C. E. GRAY. **Desiccating milk or other liquid mixtures or solutions.** The liquid is mixed with fine particles of desiccated product on which it forms a coating while suspended in a cloud or atomized spray with the solid carrier. Then the film of liquid on the carrier is desiccated by a current of dry air. The finer particles are sepd. from the finished product and the larger particles are pulverized and used as nuclei for another operation.

U. S., 1,157,959, Oct. 26. J. F. PLACE. **Process of liquefying air and separating its constituents.**

U. S., 1,158,167, Oct. 26. C. BOSCH and A. MITTASCH. **Producing ammonia catalytically** from N and H. The gases are passed over pure Fe oxide at a temp. of 600° and the flow of gas is continued after the oxide has been reduced to metal by the action of the H.

U. S., 1,158,181, Oct. 26. E. COLLETT. **Concentrating dilute nitric acid.** In removing H_2O from HNO_3 vapors by the action of H_2SO_4, conc. HNO_3 is introduced into the material under treatment, below the top of the drying tower, to prevent too great a rise in temp.

U. S., 1,158,245, Oct. 26. J. E. LAPPEN. **Flax straw** for the manuf. of felted heat-insulating sheets is immersed in degumming soln. freely moved about in the soln. and beaten and hackled while immersed to prevent breaking the fiber and facilitate the degumming. The fiber, shives and incrusting substances are then sepd. and a portion of the shives is recovered together with the fiber.

U. S., 1,158,265, Oct. 26. K. E. OLSON. **Imitation gold leaf** or other colored leaf is prepared by spraying on a sheet of glass a soln. of wax in a volatile solvent, driving off the solvent, spraying a film-forming soln. or mixt., *e. g.*, a mixt. of nitrocellulose soln., gum elemi and bronze powder, on the wax-covered glass and stripping the film from the glass after it has formed.

U. S., 1,158,366, Oct. 26. D. H. BIBB. **Briquets of ore, flue dust, etc., are formed** with a binder produced by evapg. waste sulfite liquor until a pitchy residue sol. in H_2O remains, pulverizing this pitch and molding briquets of a moistened mixt. of the binder and main body material. The molded briquets are then treated as in pat. 1,158,364 *C. A.* **9**, 3216.

U. S., 1,158,379, Oct. 26. A. E. GESSLER. **Green chromium oxide** is produced by igniting a mixt. of $Na_2Cr_2O_7$ 53, S 10 and $NaClO_3$ 1.25 parts and lixiviating the product remaining after complete combustion is effected.

Aust., 290, Jan. 12, 1914. SÄRVÄRER KUNSTSEIDENFABRIK AKT.-GES. Simultaneous manuf. of **hydrogen sulfide and the sulfides of the alkalies or alkaline earths** by heating residues containing substances with S content and having a reducing action, after admixt. with hydroxides or carbonates of the alkalies or alk. earths.

Brit., 11,094, May 5, 1914. SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ETUDE ET L'EXPLOITATION DES PROCEDES G. CLAUDE). **Drying and cooling compressed air or gas,** *e. g.*, water-gas, by heat-interchange with the cooled expanded air or gas, by causing the latter to descend tubular passages while the compressed gas ascends a confined space around them. The compressed gas is caused by baffles to follow a nearly horizontal sinuous path. The point of 0° temp. where the greatest deposit of moisture occurs, is momentarily shifted upwards, allowing the hoar frost to melt, by allowing the compressed gas to enter at a higher temp. than usual, *e. g.*, by eliminating the cooling in the last stage of compression for a time.

Brit., 11,112, May 5, 1914. MEIROWSKY & Co. and M. MEIROWSKY. In **mfg. insulating materials,** sheets of paper or other fibrous material are satd. with oil and

Digitized by Google

coated with resin and then compressed or rolled together. The material may be used for elec. insulation or for storing or conducting corrosive liquids.

Brit., 12,454, May 20, 1914. J. CADMAN. An **absorbent material for removing carbon dioxide from air** and particularly for use in breathing app., consists of a porous vehicle, such as coke or charcoal, which, by immersion in molten alkali such as NaOH, has acquired a coating or film thereof. A cooling material such as $CaCl_2$ may be added to the alkali to prevent heating of the air.

Brit., 13,479, June 2, 1914. CHEM. FABRIK RHENANIA, C. THELEN and F. WOLF. In mfg. **alkali sulfates**, the first stage of the reaction between H_2SO_4 and an alkali chloride is effected in a pear-shaped pan closed by a lid and having a rotary stirrer which, when rotated in one direction, mixes the charge and in the other direction discharges it through a connection into a muffle furnace in which the second stage is effected. The muffle is provided with stirring devices which move the charge in a spiral path from the central inlet to a circumferential exit. For the process of mfg. sodium sulfate see Ger., 279,997 (*C. A.* **9**, 1233).

Brit., 13,594, June 4, 1914. J. PRIGGE. **Etching plates** which are supported over the etching fluid, by spraying the fluid up on to the plate by scatterers in the fluid while agitating the whole surface of the fluid so that particles are scattered from the whole surface and an air gap is maintained between the surface and the plate. Means are provided to adjust the level of the fluid to maintain the distance of the plate above the fluid constant.

Brit., 13,642, June 5, 1914. P. L. PFANNENSCHMIDT. App. for **concentrating acids** comprizes a series of open pans arranged in a cascade and heated by the waste gases from a furnace, a chamber containing a number of perforated plates and placed on a hot plate of the furnace, and cooling chamber similar in construction to the chamber containing the perforated plates. Each of the open pans has a number of transverse ridges to cause the acid to follow a sinuous course, and a lip overhanging into the next pan. The acid from the last pan of the cascade passes into a tray provided with traps, and then falls through the perforated plates first mentioned, where it meets an ascending current of air which has been heated by passing through the cooling chamber aforesaid and the furnace pipes. The concd. acid collects in a trapped tray and passes by a shoot to another trapped tray; it then falls through the perforated plates aforesaid and is cooled by an ascending current of cold air.

Brit., 13,687, June 5, 1914. BADISCHE. In the catalytic oxidation of NH_3 to **nitrogen oxides**, the **catalyst**, consisting of 1 or more oxides of the metals of the Fe group, is employed in sep. pieces or lumps. It is advantageous to heat the pieces or lumps to 600–800° before use, to prevent sintering of the contact mass in the tube or furnace. The catalyst may be prepd. by breaking up an oxidized melt (obtained by burning metal powder), or by forming the pptd. hydroxides into suitably shaped pieces, or by breaking up sufficiently pure ores, or by oxidizing pieces or lumps of the metal, or by calcining decomposable salts of the metal such as the nitrate, and breaking up the mass; by this method a porous catalyst is obtained. Substances such as S, H_3PO_4, H_3BO_3, SiO_2, and alkali should not be present in the gases or in the catalyst.

Brit., 13,842, June 8, 1914. FARBW. v. M. L. & B. **Nitric acid** of a strength exceeding that of the acid of the lowest vapor pressure, such as that obtained by the process described in 15,948, 1911 (*C. A.* **7**, 223), is concd. without the aid of a desiccant by heating it, leading the resulting vapors to a fractionating column maintained at the requisite temp., and condensing the vapors which pass over. The dil. acid may be continuously admitted to the column, and the residual liquid run off from the column to the boiling vessel, whence it emerges as acid of the lowest vapor pressure.

Digitized by Google

In an example, 78% acid is treated in a column maintained at 100° for the production of 97% distillate. A lower temp. is used when the operation is effected under reduced pressure.

Brit., 13,848, June 8, 1914. BADISCHE. **Catalytic agents for use in the manuf. of nitrogen oxides** by the oxidation of NH_3 consist of mixts. of any 2 of the following classes of substances: oxides of metals of the Fe group; oxides of the rare-earth metals; oxides of Bi. In examples, catalysts are prepd. by (1) pptg. with NH_3 a soln. containing $BiONO_3$ and ferric or Mn nitrate or both of the latter, (2) melting Fe powder in the presence of O and Bi oxide, (3) pptg. with NH_4OH or Na_2CO_3 a soln. containing ferric and La or Yt nitrates, or Mn and C nitrates, or Mn, ferric, and Di nitrates, (4) pptg. with NH_4OH a soln. containing Ce, NH_4, and Bi nitrates, mixing a part of the ppt. with CaO, MgO, Al_2O_3, or other binding agent, and adding the mixt. to the other part of the ppt. Cf. *C. A.* 9, 2577.

Brit., 14,226, June 12, 1914. E. HUNEBELLE. **Obtaining pure zinc oxide.** See Ger., 275,703 (*C. A.* 8, 3246).

Brit., 14,230, June 12, 1914. DEUTSCHE GASGLÜHLICHT AKT.-GES. **A gas-tight membrane** consists of an oiled sheet or skin of bacteria, Hyphomycetes, or other accretion of microörganisms formed upon wort or other substance. After being washed, the skins have the superfluous H_2O expressed, and they are treated either directly with oil or with an emulsion of oil and an albumin soln. Linseed oil and animal glue may alternately be employed, and a small quantity of non-drying oil, such as vaseline oil, may be added to prevent cracking. The emulsion is preferably formed by addition of linseed oil soap and a few drops of alc. potash. Glycerol or soft soap may be added to confer flexibility. After the treatment with oil or emulsion, the membranes are squeezed, dried in the air, and varnished if required to be water-proof. They may be rendered gas-tight and strong by mercerization before the oil or emulsion treatment, and they may be combined with fabrics in the known manner. Several membranes may be caused to adhere together.

Brit., 14,340, June 15, 1914. W. JANENSCH. **In mixing, stirring, and aerating liquids, powders,** etc., and dissolving powders, etc., by means of an intermittent current of air or liquid drawn or forced through a downwardly tapering vessel at its lower end, the contents of the vessel are allowed to subside between the pulsations. The pipe may be tapered downward and it may be disposed within the vessel, or outside it, following its curve downward to the bottom. Cf. *C. A.* 9, 2439.

Brit., 14,357, June 15, 1914. SOC. ANON. DES POUDRES ET NITRATES. **Nitric acid** is obtained by the action of superheated steam on briquets of mixts. of $NaNO_3$ or KNO_3 and Al_2O_3 or bauxite. The reaction may be facilitated by the addition of $CaCO_3$ to the mixt.; aluminates, *e. g.*, raw aluminate previously obtained in the process, may be added to improve the porosity of the charge; Ba or Sr compds., such as the oxides, carbonates, nitrates, acetates, or carbides, may be added to render insol. any SiO_2 present. The aluminate resulting is dissolved out by H_2O and may be converted into Al_2O_3 by known processes. The HNO_3 may be passed into towers in which a countercurrent of NH_4OH or other base circulates to give NH_4NO_3 or other nitrate.

Brit., 14,393, June 15, 1914. ELEKTROCHEM. WERKE GES. App. for **obtaining large crystals.** See Ger., 273,929 (*C. A.* 8, 2788).

Brit., 14,433, June 16, 1914. A. BARBERIS. **Lubricating packing for shafts** and journals is made by treating waste residues of cotton, wool, cellulose, or other fiber with substances which render them incombustible and impermeable, thus securing economy of lubricant. The packing is first soaked in a soln. of 100 g. of alum, NH_4 phosphate, $ZnSO_4$, borax, $MgSO_4$, Na_2HPO_4, K_2HPO_4, Na tungstate, NH_4 tungstate, Al

Digitized by Google

acetate, NH_4ClO_3, or similar salt, in 1000 g. of H_2O. After pressure, the packing is soaked in a second bath consisting of 1000 g. of H_2O, 20 g. of H_3BO_3, 30 g. of gelatin, 40 g. of glycerol, 4 g. of a 36% soln. of HCHO, and 100 g. of oo graphite. The two baths may be combined.

Brit., 14,453, June 16, 1914. W. G. LITTLE and H. MORRIS. **A composition for destroying animal parasites** consists of a mixt. of soap and alkali arsenite made by mixing the molten materials or hot concd. solns. so as to give a solid mass on cooling. The product is ground or otherwise subdivided. The preferred ingredients are castor oil soap and 70–5% of Na arsenite.

Brit., 14,963, June 23, 1914. C. E. CHALLIS. **A cleaning and polishing composition** consists of kieselguhr, pumice, rotten-stone, emery or CSi, Vienna or Neuberg chalk or pptd. chalk, coloring oxide such as yellow ocher, rouge, roasted Fe_2O_3, or Mn oxide, $(NH_4OCO)_2$, a mixt. of olive-oil soap, coconut-oil soap, cottonseed oil soap, and tallow soap, oleic acid, and Russian turpentine or other deodorant. It is preferably used in a polishing cloth.

Brit., 15,038, June 23, 1914. W. G. F. SIEGMANN. **A fire-proof, water-proof, and acid-proof plastic composition.** See U. S., 1,102,358 (*C. A.* 8, 2935).

Brit., 15,053, June 23, 1914. SOC. L'AIR LIQUIDS. **Freeing gases from carbon dioxide** present as impurity by subjecting them first to a physical purification by soln. under pressure in H_2O, and then to a chem. purification by the action of a suitable reagent dissolved in the H_2O, the process being carried out in one app. and by means of one vol. of H_2O. The process is particularly applicable to the removal of CO_2 from air or other gases containing it, such as water-gas or water-gas modified by catalysis or by passage over hydrated lime, prior to liquefaction of the gas. The process is effected by bringing the compressed gas into contact with a counter-current of H_2O in a tower, at the upper portion of which is introduced a small quantity of a suitable reagent, such as lime or NaOH. The dissolved gas may be subsequently removed from the liquid by relieving the pressure thereon, and, when lime is used, the pptd. carbonate may be filtered off and the H_2O returned to the tower.

Can., 164,838, Sept. 14, 1915. F. M. BECKET. **In the manufacture of calcium carbide,** the process of prepg. aggregates suitable for furnacing, by mixing lime with coking coal in such proportions that the fixed C of the coal will substantially suffice for the reaction, the coal being sufficiently rich in bituminous matter to yield with the lime, under ordinary coking conditions, a mechanically strong aggregate suitable for furnacing, and then coking the mixt. Cf. *C. A.* 9, 1584.

Ger., 284,255, Sept. 10, 1913. R. SCHRÖTER. In mfg. **insulating bodies** from peat and a binder, such as tar pitch, porous, anhydrous, long-fiber peat is subjected while heated in a revolving drum to the action of cold and moist compressed air mixed with pulverulent binder, and then formed in presses. In detail, the peat is first acidified, exposed to the air, and dried. Then it is shredded to obtain a long fiber mass. The peat treated in this manner is exposed to a current of hot air and roasted thereby. The anhydrous heated peat is then placed in a revolving drum and compressed cold moist air, mixed with atomized tar pitch, is introduced. The desired form is given to the final product by cold or hot pressing of the mass.

Ger., 284,398, Oct. 29, 1911. F. M. MEYER. **Continuous manufacture of barium sulfide** from $BaSO_4$, whereby $BaSO_4$, in admixt. with coal, is charged into a revoluble furnace from the same side where the combustible gas is introduced, so that the product of reduction and the fire gases proceed in the same direction. If the process be carried out so that the final temp. is 800–900°, the $BaSO_4$ will be reduced almost quant. From the CO_2 and the added C, CO is formed. This can be returned to the furnace and burned as a source of heat. The endothermic character of the process in the furnace permits the introduction of the gases at the highest temp. If, however, other material is present which is decompd. during the endothermic process, the temp. should not exceed the final temp. in the furnace. In this manner the fusion of the reaction mass is avoided, and the process progresses smoothly and economically with respect to both labor and fuel. Coal, in particular, is saved, inasmuch as the reaction products, by their combustion, yield the temp. required to maintain the reaction. An excess of gas is obtained, which may be used for other purposes, as for driving motors. The resulting BaS is of loose texture, easily extd., and without BaO, while the gases are free from S and poor in CO_2.

Ger., 284,410, Dec. 3, 1913. CHEM. FABRIK VON HEYDEN, AKT.-GES. **Extracting fats** of all kinds, **hydrocarbons, sulfur,** and the like, with the use of the neutral phosphoric acid esters of the phenols and substituted phenols, especially the cheap tricresyl phosphate and its substitution products as the extg. agent. The extn. is made with hot solvent. The sepn. of the dissolved substances from the resulting soln. is effected by cooling of the soln. and the mechanical sepn. of the deposited products or by distn. under reduced pressure. If vulcanized rubber be digested with tricresyl phosphate, the S dissolves, while the rubber remains as an elastic mass.

Ger., 284,458, Aug. 17, 1913. A. DELLING. **Bleaching,** or lightening the color of, **dark tobacco leaves,** by treating them first with H_2O_2 and then with a H_2O_2 soln. acidified with a suitable acid. Citric or other organic acids are preferred, although

Ger., 284,532, Dec. 25, 1912. A. Messerschmitt. Mfg. **hydrogen from steam.** See U. S., 1,109,447 (*C. A.* 8, 3490).

19. GLASS AND CERAMICS.

G. E. BARTON, A. V. BLEININGER.

Artificial daylight for the microscope. Simon H. Gage. Cornell Univ. *Science* 42, 534–6(1915).—G. mentions a glass filter (made by H. P. Gage at the Corning Glass Works) which will render the light from a N-filled W lamp almost exactly like daylight. The compn. and construction of the glass filter are not given. L. W. Riggs.

Ceramic bodies. W. Pukall. *Sprechsaal* 48, Nos. 13–20(1915).—Two groups of white bodies are made in which RO = 0.3 K_2O, 0.7 CaO in one and 0.7 K_2O, 0.3 CaO in the other. In both, Al_2O_3 varies from 0.33 to 7 and SiO_2 from 2 to 30. Test cones of mixts. were burned to cones 7, 12, 14 and 16. At cone 7 high alkali gives grayish stoneware appearance. At cone 12 both groups were porcelain-like. The field of softened mixts. was nearly the same in the two series. The use of the tables for compounding new bodies is shown. R. K. H.

Saltpeter replacement in the enamel industry. C. Tostmann. *Keram. Rundschau* 23, 15(1915).—Oxidizing agents which might replace KNO_3 are too expensive or depend upon it in manuf. Reduction may be prevented by good draft in the furnace. Use of SnO_2 or ZrO_2 instead of Sb_2O_5 lessens the need of KNO_3. T. reports success in the use of NaCl to remove Fe. R. K. H.

Saltpeter replacement in the enamel industry. F. Kraze. *Keram. Rundschau* 23, 5–6(1915).—K. gives BaO_2 as the best substitute. He suggests the use of NaCl to remove the Fe by forming volatile chlorides. R. K. H.

Refractories for lime kilns and pulp driers of sugar factories. The Crummendorf quartz schists as a natural substitute for fire brick. Hugo Richter. *Z. Ver. Zuckerind.* 65, 263–73(1915).—Comments on criticisms of R.'s previous work (cf. *C. A.* 8, 2235) and a few additional results. The Crummendorf schists are very fine-grained, contain 95–96% SiO_2, and are exceptionally uniform as to structure and impurities. On heating, some samples contract, others expand slightly. The stone is furnished in rough or sawn blocks and is used directly as a refractory material. Sixty factories use it in place of firebrick and find that it lasts about 3 times as long.
W. L. Badger.

How to prevent efflorescence in finished brick-work. Arthur E. Williams. Univ. of Ill. *Brick and Clay Rec.* 47, 341–2(1915).—W. gives the causes for the production of efflorescence or "whitewash" on brick during the burning and cooling of the ware. Factors which will assist in avoiding the formation of the sulfate salts are: (1) making as dense a body as possible; (2) burning with a smoky atm., which, of course, can be done only in accordance with the final color desired, (3) picking S rock from the coal and clay as much as possible, and (4) cooling in an atm. free from S. A large proportion of wall white may be attributed to sol. salts in the earth or the mortar. The

Digitized by Google

sources of sol. salts other than the brick themselves are (1) the lime, (2) cement, (3) sand, (4) iron ore mortar color, especially that made by roasting pyrite, (5) salt used to prevent freezing, (6) soil about the foot of buildings, (7) manure, and (8) in large cities its presence has been explained as coming from the soot depositing on the wall. The sol. sulfates in the mortar as well as the clay should be rendered insol. by the addition of Ba compds. A simple method of detg. whether or not the burned brick will effloresce is to place a few samples on end in water, about half immersed. If they contain sol. salts, the dry end of the brick will show efflorescence in a few days and at least within a week. Distd. water should be used for this test. Similar tests with the brick set in the ground soil, the mortar, and the tap water may be made to det. the possibility of the appearance of efflorescence from these sources. ROBT. BACK.

The design and construction of down-draft kilns. A. F. GREAVES-WALKER. *Brick and Clay Rec.* 47, 343–7; 5 figs., 427–30; 2 figs. (1915). ROBT. BACK.

Drying of clay wares. ELLIS LOVEJOY. *The Clayworker* 64, 276, 4 figs., 390–1, 448–51(1915); cf. *C. A.* 9, 1679, 2974.—In Part 18, L. continues with descriptions of waste heat progressive driers. In Part 19, L. begins the calcns. for detg. air volume and heat requirement for waste heat driers. A typical problem is solved. ROBT. BACK.

Setting down-draft kilns. A. F. GREAVES-WALKER. *Brick and Clay Rec.* 47, 501–5(1915); 14 figs. ROBT. BACK.

Controlling temperatures in down-draft kilns. C. O. ARBOGUST. *Brick and Clay Rec.* 47, 591–3(1915). ROBT. BACK.

The setting of wall tile in the muffle. R. P. *Keram. Rundschau* 23, 9(1915). R. K. H.

Tile setting in continuous kilns. ANON. *Brit. Clayworker* 24, 84(1915).—Most roofing tile cannot safely be set over 6 ft. high; if the kiln is higher bricks must be set at the bottom. C. H. KERR.

The properties of technical porcelain of the Berlin Royal Porcelain Factory. REINHOLD RIEKE. Charlottenburg. *Z. angew. Chem.* 28, I, 374–6(1915).—Hard porcelain for mfg. purposes is in greater and greater demand. To a large extent development of chem. manufacturing can proceed only with development of technical porcelain. Much information is scattered through the literature. Data cover many products of many makers and detns. on one porcelain cannot be applied to another because of the influence of different compn., burning temp., methods of forming the ware, etc. Berlin technical porcelain has a d. of 2.64 when burned at 950° and 2.465 after usual final burn at about 1420°. Chem. compn. is not const. due to variation in raw materials. A typical analysis is: SiO_2, 67.5; Al_2O_3, 26.6; Fe_2O_3, 0.8; TiO_2, 0.4; CaO, 0.4; MgO, 0.3; K_2O, 3.3; and Na_2O, 0.7%. Of mechanical properties, but few measurements have been made. Compressive strength is about 4200 kg. per sq. cm. measured on 2.5 cm. cubes. Tensile strength and modulus of rupture are not well known but Hermsdorfer porcelain is stated to give 1300 to 2000 kg. per sq. cm. tensile strength. Elasticity consts. have not been detd. but the modulus of elasticity for Hermsdorfer porcelain is between 5000 and 7000 kilos per sq. mm. and Berlin porcelain is probably not very different. Absolute heat conducting capacity has not been detd. It is about 0.002 to 0.004 (somewhat greater than that of glass). Av. sp. heat of unglazed porcelain (cf. *C. A.* 8, 3844) is 0.202 for 20–200° and 0.221 20–400°. Coeff. of expansion (cf. *Keram. Rundschau* 22, 143(1914)) of unglazed pieces 50 cm. long gave the following results: 23–200°, 0.00000343; 23–400°, 0.00000353; 23–600°, 0.00000355; 23–700°, 0.00000356. Henning (*Ann. phys. chim.* [4] 22, 631 (1907)) obtained the following results: —191–16°, 0.00000177; —16–250°, 0.00000336;

Digitized by Google

—16–500°, 0.00000364; —16–1000°, 0.00000434. The coeff. of expansion is not only lower than ordinary glass, stoneware, Marquardt mass, and MgO ware of Berlin manufacture, but also the increase of coeff. with temp. is less than with those materials. Therefore, Berlin crucibles can be placed directly over the Bunsen or blast without precautions. The exact statement of softening point cannot be made since the porcelain is a complex silicate mixture and has no definite softening or m. p. Softening changes with size and shape of test piece, time of heating, etc. Detns. on a strip 6 mm. thick and 80 cm. long supported at one end and extending into a furnace for a distance of 20 cm. showed deflections of the end of the bar as follows:

Temp.	Time of heat. Min.	Deflection—sinking of end of bar. Mm.
530–560°	60	0.0
600–610°	30	2.0
600–610°	60	4.0
700–710°	30	1.9
700–710°	60	3.9
800°	30	4.5
808–900°	30	14.0
1100°	2	20.0
1100°	4	41.0

In spite of this softening below 1000° the porcelain can be used even up to 1400°. The deformation cone is 30–31 (about 1680°). The glaze showed distinct softening at about 950°. Berlin porcelain is practically gas-tight. At ordinary and high temps. a tube with 2.5 mm. walls and 20 cc. outside diameter was evacuated to 30 mm. of mercury and heated in a Heraeus furnace. Both at 1200° and 1300° the vacuum was unchanged after 15 min. Elec. cond. at ordinary temps. is almost zero. The resistance is $100–200 \times 10^{10}$ megohms per cm. The resistance decreases rapidly with the rise in temp. Cond. at 80° is 300–400 times as great as at 16°. At about 300° it becomes a fair conductor. (Cf. *C. A.* 4, 1578; *Physic. Rev.* 27, 322(1908); *Z. Elektrochem.* 13, 969(1907).) Puncturing voltage of unglazed pieces 2.5 mm. thick av. 40,000 v. The dielectric const. according to H. Starke (*Wied. Ann.* 60, 629(1897)) is 5.75. High feldspar porcelain gave much higher values; for example, Seger porcelain burned to cone 9 gave 6.61 and a still higher feldspar porcelain gave 6.84. C. H. KERR.

Determination of alumina in silicates (SELCH) 7.

ROSENTHAL, E.: **Die technischen Eigenschaften des Porzellans.** Oldenburg: G. Stalling. $0.75.

20. CEMENT AND OTHER BUILDING MATERIALS.

C. N. WILEY.

Physicochemical and colloidal properties of concrete and reinforced concrete. P. ROHLAND. *Chem. Ztg.* 38, 1067–8(1915).—The reduction of rust in reinforced concrete is not due to the local action of elec. currents since a current of less than 0.003 amp. does no damage while over 0.003 amp. causes the formation of rust. When Fe and wet-set cement are brought in contact the closest observation detects no elec. action. Should impurities such as Si and Mn cause local action in contact with the cement this would not be sufficient to cause the general rust-reducing action which occurs. Other theories of rust reduction are reviewed. In testing the setting time of cement the needle was observed to penetrate some parts of the specimen while other spots showed the beginning of set. This is attributed to the fact that non-uniform speed of coagulation was caused by the presence of very small amts. of substances which can either retard or accelerate the set and which may form during the burning or storing.

J. C. EVANS.

The value of high-pressure steam tests of portland cements. R. J. WIG AND H. A. DAVIS. Bur. Standards, *Tech. Paper* 47, 34 pp.(1915); see *C. A.* 9, 1984.

A. J. PHILLIPS.

Concrete aggregates. S. E. THOMPSON. *Trans. Intern. Eng. Congress* 1915 (advance copy)—A discussion is given of the aggregates of the U. S., economy in selection of aggregate, requirements for concrete, effect of the aggregate upon quality and strength of concrete and mortar and tests of quality and acceptance. A. A. KLEIN.

Volume changes in concrete. A. H. WHITE. Univ. Mich. *Trans. Intern. Eng. Congress* 1915 (advance copy).—A discussion is given of vol. changes in neat cement, mortar and concrete when kept continually immersed in H_2O, kept continuously in air, when alternately wetted and dried. Other phenomena are discussed, *viz.*, the effect of moisture on the strength of concrete; differential expansions of mixts. of different richness; coefficient of thermal expansion of concrete; effect of high temp.; effect of freezing; effect of vol. changes in concrete both protected and exposed to the weather. The smallest vol. changes are found in lean, porous concrete made from aged cements

Digitized by Google

and stony aggregates, *i. e.*, brick, limestone and granite. To obtain the greatest uniformity in massive concrete and to prevent horizontal cracks, there must be an uninterrupted deposition of the concrete and an interlocking of the surfaces of the layers as deposited. For the preservation of detached concrete structures from the destructive influence of atm. agencies it is necessary to have a heavy facing on external wall surfaces and a water-proof cover for other open surfaces. A. A. KLEIN.

Time and shrinkage affect stresses and deflections of reinforced-concrete beams. F. R. MCMILLAN. *Eng. Record* **72**, 251–2(1915); cf. *C. A.* **9**, 1985.—Long time tests show continued increase in strains and deflections of beams and slabs.
A. A. KLEIN.

Concrete cut from actual specimens stronger than field-sample specimens. R. E. GOODWIN. *Eng. Record* **72**, 296–7(1915).—Compressive strength tests are given for 1:2:4 concrete made of different aggregates, consistencies and types of mixing. The specimens were made in the lab. and also cut from actual structures. The latter showed higher strengths. A. A. KLEIN.

Controlling raw mix in manufacture of portland cement. S. MCANALLY. *Concrete-Cement Age* **7**, *C. M. S.* 30–1(1915).—The following lab. method is suggested for use where content of MgO varies, since MgO can replace CaO in the constituents of cement, and therefore must not be disregarded in the calculations of raw mix. Procure a large sample of raw mix. Analyze for CaO (by $KMnO_4$ method) and MgO. Since a mix containing 42% CaO and 2% MgO is satisfactory it is advizable to control all mixes on this basis as follows: If collected sample contains more than 2% MgO, est. the MgO in the sample less 2% to the equiv. quantity of CaO and add the result to the actual lime in the mix; *e. g.*, suppose that the collected sample contains 41.50% CaO and 2.38% MgO; then 2.38%–2.00% MgO calcd. to CaO and added to actual CaO equals $(0.38 \times 56)/40 + 41.50 = 0.53 + 41.50 = 42.03\%$ CaO. The mixt., therefore, is 42.03% CaO and 2% MgO. If the collected sample contains less than 2% MgO subtract actual MgO in mix from 2%. Calculate to CaO and subtract from actual CaO in the mix; *e. g.*, suppose the analysis of sample gives 42.30% CaO and 1.72% MgO, then $42.30 - [(2.00 - 1.72) \times 56]/40 = 41.91$. The standard mix is 41.91% CaO and 2% MgO. Next analyze the standard mix by the acid-alkali method and note the lime equiv. in cc. of acid. Other analyses should be compared with this standard; the standard sample must be kept for standardizing new solns. A. A. KLEIN.

Mechanical grading of concrete sand. G. P. DIECKMANN. *Concrete-Cement Age* **7**, 68–9(1915).—Tensile strength and absorption tests were made on briquets of 1:3 mortar made with sands whose mechanical compn. was varied regularly. The results show that the best and most dense mortar for concrete is obtained if a sand has the following compn.: 5–10% passing 100-mesh; 20–30% passing 50-mesh; 40% passing 30-mesh; 60% passing 20-mesh; 80% passing 10-mesh and 100% passing 4-mesh. Plotting sieve against % passing sieve, the above figures give practically a straight line. A. A. KLEIN.

Load tests on concrete pipe. E. R. CONANT. *Eng. News* **74**, 556–7(1915).—Pipe was 1:2:4 using river sand and crushed granite with standard reinforcement. The max. load per lin. foot was 2.08 tons. A. A. KLEIN.

Probable and presumptive life of concrete structures made from modern cements. B. BLOUNT. *Trans. Intern. Eng. Congress* **1915** (advance copy).—The list of possible causes of destruction of ordinary concrete are bad cement, bad aggregate, bad proportions, bad mixing, bad workmanship, bad design, external violence, fair wear and tear, action of saline solns., action of acids, electrolysis. For reinforced concrete in addition to the above causes there are corrosion of reinforcement direct or by electrolysis and

Digitized by Google

cracking due to monolithic character or possibly to stresses between the concrete and the reinforcement. Of the external causes of destruction the most important is the action of saline solns. The action of acids (notably H_2SO_4 and H_2S) is next in importance, and finally electrolysis is an important agency in destruction. A plea is made for rich, dense, impermeable concrete which is as impervious as possible to the entry of air and water. Electrolysis can be avoided by proper insulation. Any structure made well and honestly enough will vie in life with the mighty structures of antiquity.

A. A. KLEIN.

Use of wood and concrete in structures standing in sea water, with special reference to dock work. H. S. TAFT. *Trans. Intern. Eng. Congress* 1915 (advance copy).—The life and destructive action of *Teredo* and *Limnoria* are discussed. Data are given showing that the minimum probable life of wooden piles in water infested by borers is 6 mos., depending upon the location. Various methods of preservation are given and the life of the treated piles is noted. Cements suitable for sea water structures should be of the very best quality of fine pulverization, low in Al_2O_3, high in SiO_2, free as possible from gypsum, absolutely free from free lime, slow-setting and quickly hardening. Sand, gravel and stone should be of the best quality. Salt water should not be used for mixing unless fresh water is not obtainable. Many integral waterproofing compds. are of no value. Concrete should be rich, *viz.*, from 1:1.5:3 to 1:2:3. "Premolded, air-cured" concrete is much to be desired over that "cast enmasse-in-situ."

A. A. KLEIN.

Methods and equipment in the manufacture of hydrated lime. R. K. MEADE. *Concrete-Cement Age* 7, *C. M. S.* 13–17(1915); cf. *C. A.* 9, 1837—M. describes various processes for crushing the lime, mixing the lime with water and sepn. of hydrated from unhydrated lime.

21. FUELS, GAS, TAR AND COKE.

J. D. PENNOCK.

The composition of coal. DAVID T. JONES AND RICHARD V. WHEELER. *J. Chem. Soc.* 107, 1318–24(1915); cf. *C. A.* 8, 865; 9, 241.—Powdered coal was extd. with dry pyridine in a Soxhlet and the residue (*a*) dried in a vacuum. The soln. was concd. poured into H_2O and the brown ppt. obtained extd. with $CHCl_3$. The insol. residue was designated (*b*). The $CHCl_3$ soln. was evapd., yielding a brown powder (*c*). Fractions *a* and *b*, considered by the authors to consist chiefly of humic compds., yield small amts. of liquid substances only, mainly phenols, while *c*, the resinous fraction, yields below 400° no phenols but 40–50% of paraffins, olefins and naphthenes. The latter material softens at 90°, melts at 102° and evolves gases at 170°. An oil distills up to 255°, having the compn. C 86.5, H 9.88%. The gases obtained in the distn. of *a* and *b* are similar, each containing about 60% paraffins, 15% H_2 and 13% CO. The theory that phenols exist in coal in the bound condition is untenable since coal is little affected by alkalies. Furthermore, such a substance as hexahydrophenol on decompn. yields, not H_2 and phenol but H_2O and cyclohexene. H. L. OLIN.

New method of determining nitrogen in coal and coke. OSKAR SIMMERSBACH AND FRIEDRICH SOMMER. *Stahl u. Eisen* 35, 601–5(1915).—One g. of coal or coke is

Digitized by Google

mixed intimately with 26–7 g. CuO and burned in an atm. of CO_2. The N is collected over KOH soln. To remove CO, the gas is shaken in a pipet with ammoniacal Cu_2Cl_2 soln. and the vol. is measured after washing with dil. H_2SO_4. Two or 3 cc. of O are added to convert traces of NO to N_2O_4 and the latter is removed, together with the excess of O, by ammoniacal Cu_2Cl_2 soln. and the vol. of the gas is again measured. The mean of the two vols. represents the total N. Values obtained by this method are about 55% higher for coal and 27% higher for coke than those obtained by modified Kjeldahl methods. Probably most values for N in coal or coke hitherto published are considerably below the truth. W. T. HALL.

The significance of peat in industry. E. C. VERSCHOOR. *Chem. Weekblad* 11, 980–90(1914); cf. *C. A.* 7, 1798.—There is little prospect of any increase in the use of peat as a domestic fuel in cities because of its bulkiness and the increasing use of gas. At present its chief use (in Holland) is on flat grates under boilers—the most inefficient method. A large central station using step grates reports 3 kg. peat per kw.-hr. A plant using peat powder uses only 1.7 kg., but the cost of drying and grinding is nearly prohibitive. For small plants the suction producer is the most promising and several makes (German and English) gasify peat with complete success. A 50 h. p. plant reports 3.0 to 1.9 kg. peat of 44% H_2O per kw.-hr. as the load varied from 40 to 100%. A 300 h. p. plant reports 1.24 kg. peat of 25% H_2O per kw.-hr. It is calcd. that the fuel for 1 kw.-hr. costs *f* 0.004 (*f* = $0.40) for peat in a suction producer, *f* 0.007 for peat on step grates, *f* 0.007 for anthracite in a suction producer, *f* 0.01 for steam coal, and *f* 0.012 for a Diesel engine. W. L. BADGER.

Industrial uses of peat. E. C. VERSCHOOR. *Chem. Weekblad* 11, 1042–57(1914).—In using peat in a pressure producer, the opportunity of using the Mond process and recovering up to 70% of the N in the peat as $(NH_4)_2SO_4$ is a great advantage. The use of the pressure producer necessitates a larger plant than the suction producer (cf. preceding abstr.), and unless the problems of furnishing a year's supply of fuel during the summer months, and providing storage space for it, are carefully considered, serious difficulties may be experienced. Large plants have been operated a short time with complete success only to be shut down because of irregular and insufficient peat supply. If such storage can be provided the result is an extremely uniform fuel of low H_2O content for the greater part of the year. Calcns. are made for a plant containing 2 1000 h. p. engines. It is assumed that from a ton (metric) of peat there can be obtained gas for 1000 h. p.-hrs., 35 kg. $(NH_4)_2SO_4$, and 30 kg. tar. On this basis the power should cost *f* 0.0045 per h. p.-hr. (*f* = $0.40). This does not include the fixed charges on any elec. equipment; with these included the cost becomes *f* 0.0083. By assuming a little more favorable conditions, though not more favorable than have been reported from existing plants, it is calc. that 1 h. p.-year could be generated for *f* 30. It is calcd. that one district in Holland which has been fairly well surveyed would operate such a plant 42 years. The use of gas from such a plant in Bone-Schnabel boilers instead of gas engines is calcd. as calling for a consumption of 2 kg. air-dry peat per h. p.-hr. where the same peat on step grates needs 3.3 kg. [These 2 papers contain little new beyond the calcns. but present an extensive summary and comparison of data which is widely scattered and not easily accessible.—ABSTR.] W. L. BADGER.

Improvements in firing construction for solid fuels. PRADEL. *Feuerungstechnik* 3, 236–40(1915); cf. *C. A.* 9, 1682.—A review of recent inventions covering stokers, ash scrapers for fire tubes of boilers, hoppers, suction for removal of combustion residues, ash cooling, chains and grates for chain grates, safety and regulation appliances and improvements for firing with fuels rich in gases. Chem. Ztg. 18, 103–4(1915).—The SO_2 content in the gases can be materially diminished by the addition of CaO to the coal. ARTHUR LEDERER.

A bibliography of the chemistry of gas manufacture. W. F. RITTMAN AND M. C. WHITAKER. *Bur. Mines Tech. Paper* 120, 27 pp.(1915).—The references are classified under 10 main headings with cross references where necessary. An author and subject index is included. E. H.

Thermoelectric flue gas tester. ANON. *Feuerungstechnik* 2, 100; *Wochschr. Zentralver. Rübenzuckerind* 53, 182(1915).—A stream of the gas at const. temp. and velocity is led through KOH, and the heat evolved by the absorption of the CO_2 is measured by a thermopile connected to either an indicating or recording instrument. Made by Keiser and Schmidt. W. L. BADGER.

Gas generators producing liquid slags. GWOSDZ. *Feuerungstechnik* 3, 221–3 (1915).—A review supplementing that of Voigt's (*C. A.* 9, 1990) of generators producing liquid slags. Sailler's generator is mentioned as one of the early types and is briefly described with the difficulties that were desired to be overcome. Methods of construction used in several generators to prevent the formation of slag in the air passages are given. H. R. GUNDLACH.

The numerical and graphic representation of the colors of solids. L. BLOCH. *J. Gasbel.* 58, 121–7, 137–8(1915).—A comparison is made of the intensity of red, green, and blue light reflected from the surface in question and then from a white standard surface. The ratios red/green and blue/green used for designating the colors of lights (*J. Gasbel.* 57, 241–8(1914)), cannot be used, as they do not distinguish between shades of the same color, and represent as different colors different intensities of the same color. By taking 3 coördinates in space at right angles, black being the origin, and percent of red, green, and blue the 3 axes, a cube is obtained within which are all possible colors. Maxwell's color triangle is the diagonal plane joining the red, green, and blue corners. The colorimeter used consists of a box containing a standard white plate, the color to be compared, and an eyepiece which gives the usual circular field, half of each. In the eyepiece is a revolving slide with the three test glasses and a plain opening (Jena filters F4512, F6389, and F3873). The light enters through a side tube at an angle of 45° to the surfaces, and may be daylight or any artificial light provided it is uniformly diffuse. Fifty candles are sufficient and may be supplied by incandescent lights in an Ulbricht's sphere. The standard is illuminated through a fixed aperture and the unknown by an aperture whose area is regulated until the field is uniform. By calibration with a standard white in place of the unknown, the 100 % point for each color is detd. and then results for unknowns are expressed in % of the standard. A place is provided for transparent solids or solns. in the path of the variable light. The white standard is best made by smoking a metal plate with burning Mg. This is uniform, mat, and reproducible. For textiles and other materials with oriented structure, the receptacle for the sample may be rotated and its color detd. in different directions. Since the results are detd. by comparison with a white surface, they are independent of the kind of light used. By comparing 2 standard whites, one illuminated by daylight and the other by the source in question; and then comparing a color with the standard under any illumination, a set of ratios may be obtained from which the apparent color of the sample in a given light may be detd. The app. is made by Frantz Schmidt and Hantzsch. W. L. BADGER.

The use of coke in gas producers. HENRY MARKGRAF. *Stahl u. Eisen* 35, 373–5(1915).—Producers operated at a plant in Lorraine, using only coke, furnished a gas which compared very favorably with producers using coal. In some cases 1/4 to 1/2 coal was mixed with the coke. The gas was used in the rolling mills. It burned with a long flame more transparent than the ordinary flame. CARLE R. HAYWARD.

Digitized by Google

The use of coke in gas producers. ANON. *Stahl u. Eisen* 35, 507–8(1915).—When coke is used alone the gas has a lower calorific power than when coal is used, because of the lack of CH_4. Mixts. of half coal and half coke have given a satisfactory gas. The flame was more transparent than that of ordinary producer gas. The coke should be crushed to nut size to secure the best results. The crushing adds to the cost of the coke and local conditions of transportation, etc., together with this crushing cost enter into a comparison of the producer results. CARLE R. HAYWARD.

Briquets from coke breeze. BEHR. *Feuerungstechnik* 3, 262–3(1915); cf. *C. A.* 9, 2144.—Expts. conducted by B. showed that briquets could not be made by a cold method and that a brittle material must be used as a binder to increase the resistance of the briquet to weathering and pressure. Hard pitch was found to be a satisfactory binder. The pitch is ground to a fine powder, 7% added to the coke breeze and thoroughly mixed. The mixt. is heated to 350° by means of superheated steam with simultaneous introduction of part of the flue gases from the superheater. The soft mass is then conveyed to the press and the briquets formed. A brief description is given of the machinery used. H. R. GUNDLACH.

Theoretical and practical determination of coke-oven thermal balances. HUGO KRUEGER. *Stahl u. Eisen* 35, 477–83(1915).—The heat required to coke coal containing various quantities of H_2O was theoretically detd. in an elec. lab. furnace and the result was found to agree fairly well with the figure calcd. from data obtained from com. ovens. The greatest loss of heat was found to be the heat contained in the hot coke on discharging. Some means should be found for saving this. CARLE R. HAYWARD.

Heating coke-ovens from the top. OSKAR SIMMERSBACH. *Stahl u. Eisen* 35, 745–52(1915).—The expts. indicate satisfactory results with top heating. This will allow a lowering of the height of the ovens. CARLE R. HAYWARD.

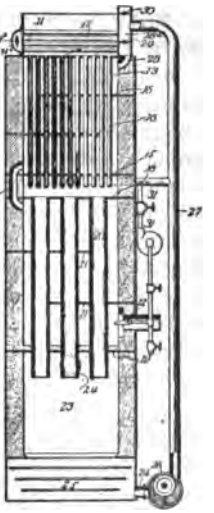
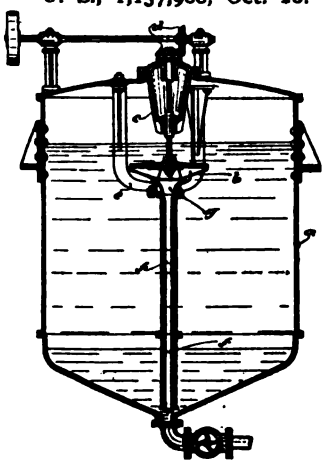
U. S., 1,157,089, Oct. 19. S. M. DARLING. **Making gas from lignite.** Lignite from the hopper *11* descends by gravity past angle-bars *12* into the tubes *13* depending from the flue-sheet *14*. Fuel in the lower section of the app. is ignited at the point *22* and combustion products pass upward through the by-pass *17* around the tubes *13* from which the lignite finally descends into the lower tubes *20* where it is destructively distd. and treated with CO_2 and steam. The resulting gas is drawn off through the outlet *24*. Steam and gas driven off from the lignite in the upper tubes are passed to the lower portion of the app. to increase the amt. of gas.



U. S., 1,157,988, Oct. 26. H. KOPPERS. **Apparatus for purifying benzene by treatment with sulfuric acid.** The centrifugal wheel *b* sucks acid up through the pipe *f* and mixes it with the C_6H_6 in the upper part of the app.; when not in operation only the pipe *f* and bottom of the tank are in contact with the acid.



Brit., 10,780, May 1, 1914. L. C. BONNEAU and V. E. HASENFRATZ. Construction and operation of a plant for **treating gas-purifier waste** with C_2HCl_3. When the material is completely extd., the soln. is directed to a reservoir. H_2O from a pipe is then admitted to the extn. chamber and the mixt. is transferred to a mixer provided with a stirrer and a source of heat, and attached to a condenser for recovering the remaining solvent. $Ca(OH)_2$ is then added, and after heating to boiling, the mixt. is transferred to a column still. The NH_3, after passing through a second column, is absorbed in a saturator, connected with acid and liquor tanks, and the vapors not condensed are passed to the furnace and burned. The $(NH_4)_2SO_4$ is discharged to a centrifugal drier. The insol. matter from the still is washed; the washings are returned to the extn. chamber and may be re-oxidized and used again. The soln. is passed into settling vats, KCl is added, to ppt. $CaK_2Fe(CN)_6$, which is treated in the 2nd vat with Na_2CO_3 to obtain sol. $K_2Na_2Fe(CN)_6$. This is acidified with H_2SO_4 and treated with $FeSO_4$, the white ppt. being oxidized by NaOCl or H_2O_2, to obtain Prussian blue.

U. S., 1,158,367, Oct. 26. G. BLIEBERGER. **A fuel for internal combustion engines** is produced by mixing MeOH 100, acetone 5, $PbCO_3$ 5 and sylvic acid 15 parts, distilling the mixt. and collecting the distillate up to 110°, adding it to petroleum distillate obtained between 150 and 300° and gasoline and sepg. the liquid product from the sediment which deposits on standing.

Brit., 14,973, June 23, 1913. I. MORR. In **mfg. incandescent gas mantles,** the mantles are strengthened by applying to the finished but unvarnished mantle a suspension of refined, white China clay in H_2O, containing about 100 parts by wt. of China clay in 7,500–8,000 parts of H_2O. $K_2Mn_2O_8$, 1 part, may be added to prevent brittleness. The liquid may be applied to the mantle by spraying; the mantle is then heated to incandescence, and may afterwards be varnished.

Brit., 11,178, May 6, 1914. H. J. Toogood. **A charge support for vertical gas-retorts.**

Brit., 11,236, May 6, 1914. F. Haber and R. Leiser. In app. for **testing gases** consisting of 2 closed organ pipes, 1 at least of which is a membrane pipe, blown by the same gas current, alterations in pitch in the 2 pipes due to variations in pressure in the blowing current are avoided by providing a pressure regulator in the gas passage, and making the pipes long and blowing to an overtone. In addition, the strength of the blast on the 2 pipes may be equalized by providing throttling devices in 1 or both of the branch passages leading to the pipes, or by making the blowing slits of the pipes adjustable.

Brit., 11,246, May 6, 1914. H. F. Smith. **Removing tar particles** or other impurities **from gas** by passing the gas through a pervious medium at sufficient velocity to cause the particles to become attracted by and pptd. on the medium by the static elec. which is generated by the friction of the gas passing through the medium.

Brit., 11,345, May 8, 1914. E. Eaton. Mfg. **composition fuel** by introducing steam, laden with petroleum or other oily vapor, into a mixt. comprizing 88 parts of chalk, 12 of solidified tar, and from 2 to 5 of oil, such as petroleum or naphtha oil from tar. The steam may be led through a tank of oil, which may be heated.

Brit., 12,400, May 20, 1914. T. R. Wollaston. In **gas-producers** of the kind having a grate, nozzle, or blast-distributing device serving to support the fuel, means are provided for superheating the blast and stirring the fuel consisting of a blast-heating pipe arranged at or near the center of the producer and extending from a fixed or rotating grate, or depending from a rotary or oscillating crown. The blast-pipe may be cylindrical, elliptical, triangular, or of other shape in cross-section, and is provided with an internal pipe delivering the blast to its upper closed end, from which it passes downward to the grate, etc. Cf. *C. A.* 9, 1544.

Brit., 13,930, June 9, 1914. Soc. d'Exploitation des Appareils Rateau. Constructional details of a **centrifugal fan for separating dust, tar,** etc., **from gases.**

Brit., 14,013, June 10, 1914. E. Eaton. **Composition fuel consists of 40 parts** of chalk, 40 of carbonaceous material such as small coal, coke, cinders, ashes, or clinker, 12 of clay, and 8 of solidified tar, the whole being pugged with admitted steam, which may bear oily vapors, and pressed. The ash is suitable for mfg. cement. Cf. *C. A.* 8, 3233.

Brit., 14,243, June 13, 1914. C. Still. In order to equalize the suction exerted by the exhauster on the various **coke ovens** of a battery, the gas is drawn off from a collecting-main through a subsidiary main extending parallel to the collecting-main, and connected thereto by a series of openings, which increase in cross-sectional area with the distance from a pipe leading from the main to the exhauster.

Brit., 14,458, June 16, 1914. J. W. Hughes. In **furnace operations,** raw and finished articles are simultaneously fed on to and removed from a traveling hearth by endless conveyors extending transversely across the surface of the hearth.

Brit., 14,618, June 18, 1914. J. S. Bean and H. Nash. In a process of **utilizing waste from locomotives,** smoke-box refuse from locomotives is fed to a gas-producer and the gas produced is utilized for raising steam in locomotives prior to going on service or for heating feed-water or other heating purposes connected with steam locomotives. The blow-down water from locomotives is led through a tank where it communi-

Digitized by Google

cates heat to tubular feed-water heating app., and is finally led to settling and storage tanks, from which it may be drawn and heated for use as feed H_2O or for washing out boilers.

Brit., 13,934, Jan. 5, 1915. A. M. DUCKHAM. **In carbonizing retorts,** through which the fuel is conveyed in the direction of increasing temp., collecting chambers are arranged alongside each retort to sep. the distn. products from zones of different temp. Steam may be introduced into the hottest zone to increase the production of NH_3. The retorts are built of steel plates and channel irons, and the collecting chambers are formed by channel irons and are subdivided by transverse partitions. Each compartment is fitted with an outlet pipe so as to form a common passage for gases and liquids to collecting mains, resp. The outlets from the retorts are made by bending outwards angular pieces cut in the sides. Gas burners are placed in the flues near the discharge ends of the retorts, and air-supply openings are formed by cutting away a part of the channel iron at the side of the flue.

Ger., 282,591, June 30, 1912. DR. MIECZYSLAW VON WIERUSZ-KOWALSKI. **In mfg. fodder briquets from hay, straw, and other fodder,** beets or other saccharíferous plants, in comminuted form, are subjected after warming with H_2O to the action of alkalies, such as soda, the resulting gelatinous mass, after cooling, is neutralized with HCl or other acid, the product is added to the hay, straw, or the like, as a binder, and the mixt. is briquetted in the usual manner. The amt. of added alkali, its period of action, and the temp. depend upon the kind and quality of the beets used. If the beets are withered or woody the amt. of alkali must be greater and the temp. higher. According to the quality of the beets the temp. varies between 70 and 95°, and the amt. of alkali between 2 and 8%. It is applied in the form of a 25% soln. By heating with alkalies a sterilization of the mass is also effected. A low pressure is sufficient in making the briquets, since the firmness of the latter is secured by the binder.

Ger., 283,434, July 8, 1910. J. FEYÉR. **Method for firing with bituminous fuel** whereby the fire box is surrounded by a mantle for the introduction of air for combustion.

Ger., 283,534, Jan. 21, 1911. GES. FÜR INDUSTRIELLEN OFENBAU POPPE & CO. **Pressure carbonization of moist slime and peat.** The dredged or cut material is spread out upon drying surfaces, and after a certain amt. of H_2O has been lost, dependent upon the weather, it is brought together in low heaps, and then shovelled, the wet with the dry, into heaps of about 8 m. in height. Heating in these heaps to 82° results spontaneously, and the height is reduced one-half. Even in the years with most frequent rains the H_2O content is reduced to below 40%, and the pressure exerted by the heap effects a degree of carbonization. The product has the consistence of briquet material, is a good fuel, and may be transported readily.

Ger., 283,772, Sept. 16, 1913. H. JUNKERS. **Heat exchanging device** for high pressure steam, wherein the steam imparts its heat to the walls of a group of tubes.

Ger., 283,924, May 8, 1914. Addition to 237,095 (*C. A.* 6, 1982). H. KOPPERS. **Preheating air for large chamber furnaces** for the production of gas and coke.

Ger., 283,995, June 7, 1913. CHEM. FABRIKEN DR. K. ALBERT and DR. L. BERREND. **A fuel** is prepd. from mineral and like oils with the use of an emulsion of the oils and sulfite cellulose back water as a binder. If desired, wood, peat, coal, leather, and other combustible materials may be incorporated with these emulsions. The thick,

Digitized by Google

tenacious mass obtained from mineral oils and the like and sulfite cellulose back water burns rapidly after being kindled, leaving a white ash and producing very little soot. The fuel product is not explosive, and will not be kindled merely by sparks or incandescent bodies. The ignited mass can be readily extinguished at any time, and can be fired in any form of furnace.

Ger., 284,359, Sept. 20, 1913. E. FLEISCHER. **Mfg. fuel gas, with the withdrawal of the product from the combustion zone without its contact with cooler fuel.**

Ger., 284,402, Feb. 3, 1914. C. DINSE. **In mfg. a fuel from ashes and mineral oils or their residues, a sludge of ash, petroleum, and finely divided sawdust is mixed with sufficient boiling paraffin to form a mass which solidifies on cooling.** *E. g.*, 255 g. fine wood or coal ash are mixed with 100 g. petroleum to a thin slurry free from lumps. Finely divided sawdust 20 g. is added and the mixt. stirred with 125 g. boiling paraffin. As soon as the thoroughly worked mass is stiff it is compressed into sheets. The product is said to be readily ignitable.

22. PETROLEUM, ASPHALT AND WOOD PRODUCTS.

F. M. ROGERS.

The range of applicability of the liquid sulfur dioxide method for determination of aromatic constituents in hydrocarbon mixtures. W. F. RITTMAN AND R. J. MOORE. *Met. Chem. Eng.* 13, 713–4(1915).—The authors conclude from expts. on known mixts. that the Edleanu method works well for the estn. of small quantities of aromatic hydrocarbons, but is not applicable where the amt. exceeds 25%. Conc. mixts. can be dild. with pure water-white Pen. kerosene. Temp. at which extns. are performed must be low, preferably about —20°. F. M. ROGERS.

Discrimination of benzine and benzene. (A test for benzene in benzine.) H. MIX. Helfenberg. *Kolloid Z.* 17, 7–9(1915).—The dragon wood of Sumatra contains a red resin that if, first washed with hot petroleum, heavy benzine, light benzine and then cold benzine, is colorless but with even traces of benzene gives a red color. This resin is called "dracorubin" and may be dissolved in benzene and taken up with filter paper making a dark red, gummy test paper which will distinguish between benzine and benzene, detect traces of benzene in benzine and give a criterion for the degree of refinement of benzine, which is the greater the less color the benzine gives with this paper. A table shows the effect of 30 org. liquids classifying both the color of the liquid after treatment with the test paper and the color of the test paper after the tested liquid has evapd. The color effects with benzene are characteristic and indicate even small amounts of benzene but would not furnish a quant. colorimetric method for benzene.

H. I. MATTILL.

Industrial oil firing installations. R. SCHMITT. *Feuerungstechnik* 3, 257–61, 272–6(1915).—The methods of oil firing are differentiated according to whether the oil is fired in its original condition, atomized or in the gasified state. S. describes a number of types of construction that may be used for one of the above methods of firing oil. Detailed drawings and descriptions of furnaces of various types used in the metallurgical, chemical, and ceramic industries are given. A comparison of costs of firing with a good quality of bituminous coal and oil is made and S. concludes that oil firing is advantageous even when the cost of the oil is twice that of the coal. H. R. GUNDLACH.

Atomizing burners for oil-firing. ESSICH. *Feuerungstechnik* 3, 245–7(1915).—E. describes the advantages of firing oil by means of atomizing nozzles, and discredits the adherents of the oil gasification firing, who claim that atomized oil is incompletely burned with resulting sepn. of C. One of first conditions of oil firing is that none of

Digitized by Google

the unvaporized oil shall come into contact with the furnace walls. The atomized oil from the nozzle is gasified by the heat radiated from the burning oil, and in a properly adjusted nozzle the air and oil mixt. should be completely vaporized at a very short distance from the nozzle. Nozzles used for atomizing oil by means of air under pressure and those used for atomizing preheated oil under its own pressure are briefly described with illustrations. H. R. GUNDLACH.

Turbine lubricants (OTTO) 27. Chemical control in the manufacture of machine greases (DAVIDSOHN) 27.

U. S., 1,156,969, Oct. 19. W. A. BEATTY. **Threads for weaving into fabrics** are formed of cellulose acetate and dihydroxydiphenyldimethylmethane.

U. S., 1,158,400, Oct. 26. W. P. COHOE. **Thin walled tubes for casing sausages** are formed of cellulose hydrate waterproofed with gelatin treated with alum, CH_2O or tannin.

Brit., 13,696, June 5, 1914. SOC. CHIMIQUE DES USINES DU RHONE (ANCIENNEMENT GILLIARD, P. MONNET, ET CARTIER). In the manuf. of **cellulose esters of fatty acids**, the cellulose is subjected to a preliminary treatment with small quantities of Ac_2O in the presence of a catalyzer dild. with glacial HOAc. *E. g.*, cellulose is warmed with a mixt. of glacial HOAc, H_2SO_4, and about $^1/_6$ of the Ac_2O required for acetylation. After a suitable time, the remainder of the anhydride is added, and the acetylation conducted as usual. The acetate obtained is characterized by insoly. in nitrobenzene,

Digitized by Google

acetone, or ether, slight soly. in alc., and ready soly. in $CHCl_3$. The acetates may be partly saponified in soln., giving acetates sol. in acetone, plastic in $CHCl_3$, EtOAc, and $C_2H_2Cl_4$.

Brit., 14,042, June 10, 1914. BADISCHE. **Cellulose acetate solutions,** suitable for lacquering and for the production of artificial silk or of films, are prepd. by dissolving acetone-sol. acetylcellulose in a fully hydrogenized monocyclic ketone, particularly cyclohexanone or methyl cyclohexanone, with or without another solvent or diluent, such as alc., acetone, EtOAc, or benzene.

Brit., 14,070, June 11, 1914. S. MILNE. In a process of **refining** the insufficiently **digested** portions of **esparto** and like **pulp,** to bring them into a condition most suitable for bleaching and to render subsequent straining unnecessary, the pulp, which may be prepd. either by digesting in app. of the kind described in 12,881, 1914, and washing in app. of the kind described in 6,948, 1914, or in the ordinary way, and reduced to pulp in a hollander or kneader, is delivered from a chest to a sand table, a strainer which removes roots and other unusable matter, a fine strainer, and concentrators to a tank. The portion rejected by the fine strainer passes through a concentrator to a refining engine which seps. the fiber bundles, and returns the pulp to the chest from which it is passed again with fresh pulp to the sand table. The strainer may be dispensed with, the unusable matter being removed from the rejections of the strainer by an auxiliary strainer. The refiner may be placed so that the whole of the material is treated after it passes the first strainer, and before it passes the fine strainer, the rejections from both strainers being treated by the auxiliary strainer which removes the unusable matter and allows the usable pulp to return to the chest, where it mixes with fresh pulp.

Brit., 14,111, June 11, 1914. A. H. KILNER and FOOD FLAVOR PRESERVATION PROCESS. **Bags** or receptacles of paper or fabric for **enclosing** articles of food for **cold storage** are impregnated with viscose or other cellulose soln. to render them practically impervious to air.

Brit., 14,216, June 12, 1914. E. BERL and M. ISLER. In the manuf. of **artificial silk, horsehair,** etc., **and films** from solns. of nitrocellulose, the squirting soln. consists of a collodion prepd. from a nitrocellulose containing 20–30% of H_2O, and the coagulating-bath contains 25–50 vol. % of alc. while it is maintained at a temp. not above the b. p. of ether, *e. g.*, 35.5°. The collodion may be prepd. with a mixt. of alc. and ether, in which the former predominates. Cf. *C. A.* 8, 825.

Brit., 14,339, June 15, 1914. L. LILIENFELD. **Solutions of polymerized cellulose xanthates** are prepd. by heating raw viscose until the xanthogenate ppts., washing with H_2O the ppt., and redissolving in alkali. It is preferred to use viscose containing not more than 5% of cellulose, and to effect the pptn. at 60–80°. A viscose very suitable for the process is prepd. according to the process of 1,378, 1912 (*C. A.* 7, 2307). The solns. so obtained are free from color and very permanent, give threads and films which are transparent and very strong, and may also be used in the prepn. of plastic masses, dressings and loadings for fabrics, paints and coatings, and sizes for paper, and in printing on textiles.

Brit., 14,421, June 16, 1914. J. L. JARDINE and T. A. NELSON. App. for **preparing bamboo and kindred material for the manufacture of pulp.**

Ger., 283,210, Sept. 26, 1913. M. SCHMIDT. Mfg. a solid acid- and heat-resisting coating on **drying cylinders for parchment paper** whereby a soft, permanent, dust-free product is obtained. As a result of the drying of the parchment paper, prepd. by the action of a H_2SO_4 of 50–60° and subsequent treatment with a NaCl soln., using the usual Fe drying cylinders, the surface of the cylinder is strongly attacked and oxidized so that the parchment paper contains yellow flecks. In order to provide a coating on

Digitized by Google

the cylinder which will prevent such oxidation, the surface is at first thoroughly cleaned and polished to remove dirt, rust and the like. The surface is then brushed over with a mixt. of benzine 1 and camphor oil 3. The first coating is then applied, consisting of a mixt. of 30 parts of the sap of *Rhus vernicifera*, 30 of lamp black, 20 of powdered Al, 10 of turpentine, and 10 of alc. After this coating is completely hardened by passing over it large amts. of moist air, it is coated with pure camphor spirit. A second coating of the same mixt. is then applied. After this also has hardened and has been coated with camphor spirit, the cylinder is ready for use. The coating adheres firmly to the cylinders so that it does not scale, and is also resistant to heat and acid.

Ger., 283,290, Sept. 17, 1913. Addition to 279,517 (*C. A.* 9, 1247). C. BRAUN. Mfg. a light colored and easily bleached **cellulose** from red beech wood by boiling the shredded wood in the boiler at a temp. rizing to 140°, with lyes of Ca, Mg, or alkali bisulfite, which, dependent upon the age and moisture content of the wood, contain between 40 and 60% of combined SO_2. The amt. of alkali present is sufficient to combine with the acid products of decompn. resulting from the boiling process. After expulsion of the lyes the residual lye is removed as quickly as possible with the most effective exclusion of atm. air possible. After the uniformly and carefully disintegrated wood is placed in the boiler, it is subjected to a preliminary steaming at a temp. not above 120°, then steam and H_2O of condensation are drawn off, and $Ca(HSO_3)_2$ lye, or the like, is introduced with the aid of the resulting vacuum, applying for 100 kg. wood, 18 kg. SO_2, of which 55% is combined with CaO. The temp. is then increased, during a period of 8 hrs., to 150°, and maintained there for 1 hr. With a residual content of 0.3–0.4% SO_2 the lye is blown out, then H_2O containing warm or reducing substances is introduced as a wash, or the product is discharged into such wash H_2O, taking care to effect a rapid removal of the lye. The red beech product obtained by this process with the aid of $Ca(HSO_3)_2$ lye can be bleached with about 12% $CaOCl_2$, while by employing Mg or alkali bisulfite lye a product is obtained which can be bleached with 8–9% $CaOCl_2$. Cf. *C. A.* 9, 1247.

Ger., 283,304, Dec. 28, 1913. R. ADLER. Mfg. sol. or dissolved **cellulose derivatives** by mixing the reaction mixt. obtained in the usual manner by heating cellulose with HNO_3, with hydroxides or carbonates of the alk. earths or heavy metals. The sol. nitrates are then extd. from the salt. mixt. by means of H_2O, and an acid whose alk.-earth or heavy metal salt is insol. in H_2O is added to the washed salt of the oxidized cellulose. The required amt. of an alkali or NH_4 salt soln. for the soln. of the oxidized cellulose is then added, the liquid is sepd. from the insol. alk.-earth or heavy metal salt, and evapd. to the desired concn. The end products can serve, in the form of their solns., for the production of articles of pure cellulose.

Ger., 283,577, Jan. 25, 1914. P. NEBRICH. App. for **recovering acid from cellulose gases**, and using them for strengthening the boiling lye.

Ammunition manufacture in Canadian and American plants. F. HEYN. *Stahl u. Eisen* 35, 545–9(1915).—The 32 operations required for producing a schrapnel shell are tabulated and a few briefly commented upon. The av. time for producing a schrapnel shell at the Dominion Bridge Co. plant is 1.06 hr. CARLE R. HAYWARD.

The precipitation of trinitrotoluene from concentrated acid solutions by means of water. W. MCHUTCHISON AND R. WRIGHT. *J. Soc. Chem. Ind.* 34, 781–2(1915).—The object of the investigation was to det. the minimum quantity of water necessary for the complete sepn. of the explosive from its mother liquor in order to avoid unnecessary expense in the recovery of the spent acids. Using specially prepared acid solns. and also acid residues from explosives works it was found that the max. pptn. of trinitrotoluene occurred on addition of the acid to 4–5 vols. of water. A greater diln. or the addition of the water to the acid proved less efficient. CHARLES E. MUNROE.

The trinitrotoluene industry in Italy and its conditions of development. M. GIUA. *Monitore tecnico;* through *Z. ges. Schiess-Sprengstoffw.* 10, 109–11(1915).—G. gives information on manuf. of trinitrotoluene (TNT) and discusses conditions of development in order to point out better ways of tar distn. Technically, toluene is nitrated in 2 phases: (1) nitration converts toluene either to mono- (a mixt. of *o*-, *m*- and *p*-) or (2) to dinitrotoluene (a mixt. of 1,2,6- and 1,2,4-). The second nitration converts mono- or dinitrotoluene to TNT. The most practical and widely adopted procedure is the conversion to the di-product, which is nitrated with refreshed acid mixt. to TNT. A high tax on alc. obtains in Italy and the product cannot be recrystd. economically; therefore dinitrotoluene (63–66°) is the starting point for nitration to TNT. Denatured alc. is not usable because pyridine gives a darkening afterwards. As carried out at Cengio (Savona) a product is obtained whose m. p. is only 1–1½° below that of the chem. pure compd. By washing repeatedly with H_2O and remelting several times a product m. 79.5–80.6° is obtained. G. states that low m. p. dinitrotoluene is used in Germany and the resultant TNT recrystd. from alc. Mono- and dinitrotoluene may be prepd. using an acid mixt. (HNO_3 and H_2SO_4) which contains on an av. 15–20% H_2O and 18–22% HNO_3. The nitrating mixt. must have an excess of HNO_3 (ordinarily 1.5–1.8 times the theoretical amt.); otherwise the resultant product is inferior. An oil is always formed; this is removed mechanically or by cooling. This oil was formerly regarded as worthless in Italy as it yielded low m. p. TNT; in Germany where TNT is recrystd. from alc. it is used as initial material. In comparison with dinitrotoluene this oil is a very cheap starting material. A table is given showing the influence of HNO_3 and H_2O. The results of the reaction are represented in a diagram as a function of temp. and time. Temp. must not rize above 110–20°. A too rapid rise is always dangerous. A table gives the compn. of mixed acid, the ratio between toluene and mixed acid and products obtained. HNO_3 varied between 15 and 30%, H_2SO_4 78 and 55% and H_2O 5 and 20%. The ratio of toluene to nitrating acid varied between 1:7 and 1:15. A powerful stirring app. is required for the manuf. of dinitrotoluene to prevent light toluene from settling above heavy nitrating acid, thus failing to react completely. The conversion of dinitrotoluene to TNT requires a perfectly anhydrous acid mixt. of H_2SO_4 and HNO_3 (18–25% in ratio of 1:4 or 1:5). The dinitro product begins to react between 60 and 65° and continues of itself. Rise in temp. must be regulated by energetic stirring or by cooling. Temp. ordinarily reaches 118–122°. A single nitration of the red or "Tropf" oil which consists of a mixt. of mono-, di-, and TNT did not give a utilizable TNT if the latter is not recrystd. from some solvent because from 5 to 7% of the oil remains unnitrated under ordinary conditions. This difficulty can be overcome if the oil is treated with an anhydrous acid mixt. within much narrower limits (about 1:2). In this case a product, m. 66°, is formed which can be sepd. from the oily, more difficultly nitrated part by cooling to 40° and allowing

Digitized by Google

oil to drop off. A second nitration will yield a product which on being washed, melted, and neutralized, melts at 80°. A curve represents the nitration process of the first phase. W. C. COPE.

Hexanitrodiphenylamine and tetranitromethylaniline. M. GIUA. *Monitore tecnico;* through *Z. ges. Schiess-Sprengstoffw.* 10, 111–12(1915).—Both of these compds. are used in the present war by the Germans and Russians. Tetranitromethylaniline (TNMA) is preferably mixed with trinitrotoluene (TNT). (This statement is doubted by German translator, Dr. Schweizer, of Italian article as it would make TNT too sensitive.) To prep. hexanitrodiphenylamine, one starts with dinitrochlorobenzene or aniline; the dinitrodiphenylamine resulting therefrom is nitrated in 2 phases to tetranitrodiphenylamine and to hexanitrodiphenylamine. The latter is a yellow substance, m. 248°, insol. in almost all org. solvents, slightly sol. in AcOH and acetone. TNMA is obtained by nitrating dimethylaniline with HNO_3. It is a faintly yellow substance, m. 127° (decompn.). When recrystd. from C_6H_6 it m. about 130°. Its use together with TNT is based on the property of these compds. of forming within definite limits an addition product which is dissociated at the m. p. as proved by G.'s expts. A table is given showing equil. between TNT and TNMA in the solid state. The condition of equil. is graphically represented; the existence of the equil. compd. between TNT and TNMA is shown by that segment of the curve which runs parallel to the abscissa; this corresponds to a concn. limit of 15.69%. W. C. COPE.

Synthetic phenol and picric acid. A. H. NEY. *Met. Chem. Eng.* 13, 686–90 (1915).—The manuf. of synthetic phenol from C_6H_6 involves the following steps: sulfonation of the C_6H_6, conversion into Ca salts, filtering off the $CaSO_4$, conversion of Ca benzenesulfonate into the Na salt and removal of the latter from pptd. $CaCO_3$, evapn. of Na salt to dryness, caustic fusion of Na salt, soln. of fusion mixt., acidulation and sepn. of phenol from the water soln. of the salts, and distn. of the crude phenol. The synthetic product possesses a disagreeable odor, characteristic of S compds. which can be removed by digesting with or distg. over wood or animal charcoal. Picric acid is formed by sulfonating phenol with 4 parts 98% H_2SO_4 and then nitrating the cooled mixt. with 4 mol. of HNO_3. Several industrial precautions are mentioned. R. L. S.

Coal dust explosions in cement mills. L. F. HOLLY. *Concrete-Cement Age* 7, *C. M. S.* 21, 3(1915).—Dust conditions practically the same as those in mines prevail in the coal-grinding section of a cement mill. This dangerous condition can be avoided by suction nozzles which suck in the dust which is piped to dust collectors and then conveyed to the coal-storage bins. A. A. KLEIN.

The explosibility of sugar dust. WHEELER. *Deut. Zuckerind.* 40, 533(1915); *Wochschr. Zentralver. Rübenzuckerind.* 53, 469(1915).—As small a source of heat as a match may ignite a cloud of sugar dust. If a cloud of sugar or dextrin dust is blown against a hot surface, it may explode. The possibility of an explosion depends not only on the temp., but on the density of the cloud and the time the particles are in contact with the source of heat. The minimum ignition temps. found were 540° for sugar or dextrin dust, and 630° for melted sugar. W. L. BADGER.

An explosion at a dye-making works. ANON. *Chem. Trade J.* 56, 123(1915). —An explosion took place in one of the color grinding sheds, due (supposedly) to overheating of a machine containing alizarin yellow. Owing to the presence of grit or other foreign substance, the color ignited and burst a huge cylinder. One man was killed. He was charging the machine consisting of a large Fe drum and several rollers for grinding the alizarin yellow. The substance is slightly more inflammable than other colors, but an explosion had never taken place before. BERMAN.

Aniline dye situation. I. F. Stone. *Met. Chem. Eng.* 13, 663–71(1915).—In this address S. reviews in detail the causes of the present shortage in coal-tar colors

Digitized by Google

and intermediates; gives statistics of consumption and production under normal conditions and since the European war; states what American manufacturers have already done and will probably do during 1916; repeatedly shows the necessity of a more equitable tariff; and suggests the possibility of government-owned factories.

L. W. RIGGS.

Theory of dyeing. J. TRAUBE. *Ber.* **48**, 938–46(1915).—Of 65 dyes which were investigated, it was found that almost all of the basic dyes cause a gelatin gel to swell, while practically all of the acid dyes have the opposite effect. T. has shown that similar effects observed on gelatin gels are applicable to other gels (*Intern. Z. phys.-chem. Biol.* **2**, 42(1915)), and it follows that these dyes have the same effects on swollen fibers. The degree of swelling on gelatin gels was detd. by finding the time required at a given temp. for a gel, with or without the addition of a dyestuff, to pass into the hydrosol. The sinking of glass spheres was the criterion of melting. Impurities in the dyes, such as dextrin and inorganic salts, were proved to be without effect or of minor importance as compared to the dyes themselves. Highly colloidal dyes have a tendency to deposit on the surface of the swollen gels, while highly disperse dyes pass into the swollen gels. To prevent this penetration and thus obtain a better dyeing, it is necessary to produce a decrease in the degree of dispersion or to cause the formation of a surface layer of colloidal ppt. (mordants). The decrease in the degree of dispersion may be produced in acid dyes by the addition of acids and in basic dyes by the addition of bases. Highly colloidal dyes do not diffuse appreciably into gelatin gel (10%), when the gel is covered with a layer of 0.1% dye soln. Disperse dyes diffuse readily under these conditions. In a few days in the case of colloidal dyes, the solns. become clear and a thick layer of dye forms at the surface of sepn. This layer adheres even when the vessel is shaken vigorously. The dye is therefore attracted and held firmly by the gel. T. considers dyeing a colloidal process, which involves chem. changes only in so far as the dyes, on being fixed by the electronegatively or electropositively charged fibers, undergo chem. processes. The most important prerequisite is a sufficient swelling of the fibers, which may be augmented by the use of acids or bases. Fibers behave in general like negatively charged gels of different degrees of swelling.

W. F. F.

Use of Knecht's process for determining the fastness of dyes to light and other agencies. ARABINDA SIRKER. Dacca Coll., East Bengal. *J. Soc. Chem. Ind.* **34**, 598–9(1915); cf. *Ibid* **24**, 154(1905); *C. A.* **6**, 2844.—Expts. proved that the difficulties previously experienced with Knecht's process of titration with $TiCl_3$ were due to the presence of air in the app. Well washed wool was dyed in each case in a bath containing 2% dyestuff and 2% H_2SO_4 (on the wt. of the wool) by boiling 1 hr. In each titration about 100 cc. of H_2O and 15–20 cc. concd. HCl were added to the sample tested, then an excess of $TiCl_3$ and the excess detd. by titrating back with standard ferric alum soln. Every precaution was taken to exclude air. The following dyes were studied: chrysoidine, benzeneazoresorcinol, benzeneazophenol, benzeneazosalicylic acid, aminoazobenzene, benzeneazophenol-*o*-sulfonic acid, sulfobenzeneazophenol, nitrobenzeneazophenol, bromobenzeneazophenol, orange II, *o*-aminoazotoluene, benzeneazodibromoaniline. The theoretical value of 0.04 g. of each dyestuff expressed in cc. of standard $TiCl_3$ is given, also the number of cc. of $TiCl_3$ required by the bath after dyeing and the number required by 2 g. of the dyed wool. To test the fastness to soap the dyed samples were steeped 15 min. at 60° in an aq. soln. of neutral soap containing 15 g. per liter, rinsed out and titrated. For alkali fastness samples were steeped 10 min. at 60° in a soln. of $Na_2CO_3.10H_2O$ (10 g. per l.). For the acid test samples were steeped 10 min. at 40° in 10% AcOH. In discussing results benzeneazophenol was taken as the standard. Of the dyes mentioned only the first 4 showed an intensity

Digitized by Google

of shade above 72% of the original intensity, after 59 days of exposure to light. Fastness to soaping and alkali was increased by the introduction of NH_2, CH_3, or OH groups or Br atoms, and decreased by SO_3H and COOH. Fastness to acid was decreased by the introduction of NH_2 groups, but increased by the introduction of other groups. All things considered, only Br atoms can be introduced without much bad effect. When benzene nuclei are replaced by naphthalene, fastness to soap, alkali, and acid is decreased. The washing out of dyes by soap and alkali depends largely on the presence of acidic groups in the dye. L. W. RIGGS.

The use of Turkone oil in wool dyeing. C. SCHONHERR. *Z. ges. Tex. Ind.* 17, 745(1914); *J. Soc. Dyers Colourists* 31, 170(1915).—A 5% soln. of Turkone oil requires considerable amounts of H_2SO_4 before the oil is pptd. and is hence very suitable for addition to acid liquors such as dye-baths, chroming baths, etc. It does not possess the peculiar odor of Turkey red oil and is more stable to hard water, particularly to Mg salts. Turkone oil has hence been largely used in the dyeing of piece goods to obtain level shades. It is particularly of value in the dyeing of woolen goods and the addition of $^2/_3$% to the dye-bath has been especially recommended in the dyeing of Fast Black on Marengo which is made very hard and brittle by the large amount of dyestuff and comparatively large addition of K_2CrO_4 to the wool. Turkone oil is also added to vats of Helindone colors to suppress the action of the alkali. L. A. OLNEY.

The action of some oxidizing agents on cellulose. HAROLD MOORE. *J. Soc. Dyers Colourists* 31, 180–3(1915).—The investigation was undertaken with a view to ascertaining the quant. relations which exist between the concns. of solns. of various oxidizing agents and the amt. of oxycellulose formed by the solns. under varying conditions. Two methods were used in detg. the amt. of oxycellulose formed; (1) Fehling soln. method, (2) a method based on the greater affinity of oxycellulose for several basic dyestuffs, notably methylene blue. Results are given in tabular form showing the amts. of oxycellulose formed when cotton yarn was treated at 15 and 45°, resp., with Cl bleach soln. of various concns. The effects of the addition of different amts. of HCl, AcOH and of NaOH to the Cl bleach soln. were also investigated. In other expts. $KMnO_4$ was used as the oxidizing agent; these were carried out at 15 and 35°, resp., using various concns. of $KMnO_4$. The tensile strength of cotton yarn was decreased gradually from 13.61 oz. when no bleach was used to 10.97 oz. when 15.3 g. Cl per l. were used in bleaching. L. A. OLNEY.

The action of solutions of Glauber's salt on wool and silk. N. BLAND AND M. FORT. *J. Soc. Dyers Colourists* 31, 178–80(1915).—B. and F. describe the detn. of the amt. of wool substance stripped when the fiber is boiled with Glauber's salt soln. Detns. were made by direct weighing of wool, evapn. of the ext. and the Kjeldahl method. Results of a number of detns. with cross bred yarn, Merino sliver and Botany sliver where 5 g. were heated with 150 cc. of water and 5 to 20% (weight of wool) of Glauber's salt show from $^1/_3$ to $^1/_2$% of wool substance stripped above the amt. removed by water alone. The wool treated with Na_2SO_4 was found to have a greater affinity for Crystal Scarlet than that treated with water alone. Silk treated with Na_2SO_4 soln. at a boil lost 6% of silk substance in addition to amt. lost when treated with water alone. In the opinion of the authors these results can be explained only by the neutral salt reaction as previously described by them (*C. A.* 7, 893, 4073). L. A. OLNEY.

Explosion at a dye-making works 24.

compds. of AcH or its derivs., the product forming with the sepn. of H_2O and halogen hydride.

Ger., 284,208, Mar. 19, 1913. FARBW. v. M. L. & B. **Mfg. condensation products of the anthraquinone series containing nitrogen** by subjecting α-anthra-N-arylpyrrolcarboxylic acids to the action of acid condensation agents, such as H_2SO_4, oleum, or chlorosulfonic acid. The products serve in part as dyes and in part as initial products for the manuf. of dyes.

Ger., 284,210, May 4, 1913. Addition to 275,220. M. KARDOS. **In mfg. vat dyes of the anthracene series, instead of employing anthracene-1,9-dicarboxylic acid** imide or its halogen substitution products, as specified in the principal process, **the** aceanthrenequinone oxime or its halogen substitution products are subjected to fusion with alkali. The dye seps. out from the dild. melt upon treatment with air or other oxidizing agents.

26. PAINTS, VARNISHES AND RESINS.

A. H. SABIN.

Manufacture and use of artificially hardened resins. O. PRAGER. *Seifensieder-Ztg.* 62, 686, 705–6(1915).—One method of hardening resins is to carry the distn. farther than ordinarily. The same result may be obtained by remelting the resin 6 or 8 times, cooling and disintegrating in the intervals. There are also 2 methods depending upon oxidation by means of air. Besides these there are the methods based on the use of oxides of metals, such as Ca, Zn, Pb, Mg, and Mn. S can also be used to the extent of 5–10% at a temp. of 150°. The product can be used as a substitute for Syrian asphalt. Resin hardened by distn. is used as brewers pitch while the oxidized resins are used to adulterate ceresin. The main use of hard resins is found in the manuf. of lacquers. E. SCHERUBEL.

Poisoning caused by vapors from waterproof paint (GRIMALDI) 11H.

U. S., 1,155,462, Oct. 5. L. E. BARTON. **A pigment containing titanium oxide** and $CaSO_4$ is made by adding $CaCl_2$ to a soln. of titanic sulfate and sepg. and calcining the composite ppt. obtained.

U. S., 1,156,079, Oct. 12. C. D. HOLLEY. **Obtaining finely divided lead** for use in making pigments. A jet of molten Pb is atomized with a jet of superheated steam and the product is collected in a settling chamber. Oxidation of the Pb may be effected by O_2 or N oxides.

U. S., 1,156,119, Oct. 12. G. WHIGELT. **A non-inflammable solvent for removing old paint** is made by mixing $C_2H_2Cl_4$ 50, dichlorohydrin 10 and dead oil 40 parts. Al palmitate or other metallic soap may be substituted for part of the dead oil Other oils and halogen derivs., *e. g.*, $C_2H_2Cl_2$ or C_2HCl_5, may be used.

U. S., 1,157,139, Oct. 19. J. ZIEBOLZ. **Turpentine-still kettle.**

U. S., 1,157,768, Oct. 26. M. FEHRINGER. **A bronze powder varnish** is formed by dissolving coumarone resin in a mixt. of benzine, gasoline, C_6H_6 and chloroethylene.

U. S., 1,158,065, Oct. 26. S. LIPSIUS. **Raised flexible printing** on bond paper in imitation of engraving is produced by printing a flat impression with an ink containing oil and pigment but no H_2O and free from quick-setting driers and then powdered shellac is fused into the printed characters. Brit., 11,394, May 8, 1914. A. HEINEMANN. **A phenol-formaldehyde condensation product** combined with As is prepd. by treating the condensate with cacodylic acid. The condensate is heated until it becomes liquid, cacodylic acid added, and the mixt. heated and stirred until thoroughly mixed. The product acts as a poison to parasites, bacteria, fungi, and manure growths, and is suitable for use in the manuf. of antifouling paints and varnishes.

27. FATS, FATTY OILS AND SOAPS.

E. SCHERUBEL.

Chemical methods for the purification of fats and oils. E. C. SUTHERLAND. *Chem. Weekblad* 11, 344–8(1914).—A résumé of 15 patents, involving, respectively, SO_2, benzenesulfonic acid, high-boiling fatty acids, alkalies + glycerol, formaldehyde, alk. sugar solns., Al_2O_3, $Ca(OH)_2$ and fullers earth, CO_2, superheated steam and air, acetyl peroxide, BaO_2, hydrosulfites, benzopurpurin, and electrolysis with 50,000 to 100,000 volts. W. L. BADGER.

Determination of vegetable fat in animal fat. F. SCHULZE. *Arch. Chem. Mikros.* 8, 18–20(1915).—A specific case of adulteration was detected as follows: 50 g. of fat were shaken with 0.2 to 0.3 g. digitonin in alc. soln. at 50 to 70° and finally filtered after adding $CHCl_3$ to dissolve the fat. The residue was dried at 40° and acetylated with Ac_2O; the excess Ac_2O was evapd. and the residue dissolved in hot abs. alc. and crystd. several times. The m. p. of the acetates was 121° and cholesterol and phytosterol crystals were observed microscopically. E. SCHERUBEL.

Turbine lubricants. F. OTTO. *Seifensieder-Ztg.* 42, 729, 749–50(1915).—Discussion of specifications. E. SCHERUBEL.

Knorr's stearin and glycerinometer. G. S. *Seifensieder-Ztg.* 42, 743(1915).—This instrument serves for the rapid detn. of the % of stearin, olein, free fatty acids and glycerol as well as the acid no. and sapon. no. of fats and oils. It consists of 2 burets, one of which holds 135 cc. and is graduated in 4 scales as follows: (1) From 0 to 100% in tenths for free acids, sapon. no. stearin or olein by using 13.5 g. of material. (2) From 0 to 135% in tenths for fats of the coconut oil group. (3) From 0 to 11.4% for use in detg. glycerol content and (4) from 0 to 14.8% for the same purpose. The other buret is of 25 cc. capacity graduated to indicate from 10 to 270 mg. KOH and is used for detg. the sapon. no. by taking 1.35 g. of material. A free acid detn. is carried out as follows: dissolve 13.5 g. fat in 25 cc. 96% alc. and add 1 cc. of 1% phenolphthalein. Titrate the soln. with 0.5 *N* KOH from the large buret, the reading of which gives the % in the case of all ordinary fats. To det. the acid no. the figure found is multiplied by 2.08. In the case of coconut oil the reading is divided by 1.35 in order to arrive at the free acid and by multiplying this by 2.08 the acid no. is obtained. The % of glycerol is read off from scale 3 or 4. To det. the sapon. no. dissolve 1.35 g. of fat in 25 cc. alc. and add 25 cc. 0.5 *N* alc. KOH and an indicator. After boiling ½ hr. titrate the soln. with 0.5 *N* HCl from the small buret, the reading of which gives the result. E. SCHERUBEL.

Chemical control in the manufacture of machine greases. J. DAVIDSOHN. *Seifenfabr.* 35, 750–2, 774–6, 795–7(1915).—Discussion of raw materials and their testing and analysis by well-known methods. E. SCHERUBEL.

War soap. F. G. *Seifenfabr.* 35, 773–4(1915).—Comments on the use of KOH in place of NaOH in making curd soaps. To offset the higher cost of the KOH it is claimed that a higher yield can be obtained without resorting to the addition of fillers. E. SCHERUBEL.

Manufacture of soap and washing powders. A. ENVERS. *Seifensieder-Ztg.* 42, 723–4(1915).—This is a general description. E. SCHERUBEL.

Analysis of glycerol. W. STEINFELS. *Seifensieder-Ztg.* 42, 721–3(1915).—A description is given of a well-known variation of the dichromate method in which $Na_2S_2O_3$ and starch soln. are used to titrate the I freed by the excess $K_2Cr_2O_7$. S. divides the glycerol solns. into 2 groups: those contg. a low content with high impurities, and those having high glycerol content and small amount of impurities. The first group is purified as follows: Neutralize 10 g. of soln. with AcOH if alk. and then make alk. with KOH, transfer to a 250 cc. flask and add 25 cc. of a 10% soln. of $ZnSO_4$ and enough of a 10% Pb acetate soln. so that a drop causes no further pptn. For every 10 cc. of the latter add 0.15 cc. of H_2O above vol. mark in order to take care of vol. of ppt. The glycerol detn. is made on the filtered soln. in the usual manner. The purification of the 2nd group is carried out with Ag_2CO_3. The time of oxidation can be reduced to 15 min. without affecting results by heating over direct flame. E. S.

Utilization of fatty residues in the stearin industry. H. WALTER. *Seifensieder-Ztg.* 42, 761–2(1915).—These residues result from purification, cleavage and distn. of the fats. Since the war they are treated further and utilized. E. SCHERUBEL.

Use of caustic potash in curd soaps. J. SCHAAL. *Seifenfabr.* 35, 793–5(1915).—Description of the manuf. of K soap, which does not differ materially from that of a Na soap. E. SCHERUBEL.

Household soaps during war time. E. *Seifensieder-Ztg.* 42, 741–3(1915).—Discussion of calcns. and costs. E. SCHERUBEL.

Filled soaps. E. *Seifensieder-Ztg.* 42, 700–2(1915).—Formulas and discussion of mfg. for small establishments. E. SCHERUBEL.

Washing materials. G. FENDLER. Berlin. *Seifensieder-Ztg.* 42, 697–700(1915).—In general, pure soap is the best washing material and then soda. The action of H_2O and soda soln. at room temp. upon cotton fibers with regard to ductility expressed as % of original length is shown in tabular form. The av. figure for fibers 14 days in H_2O is 18.3, and in strong Na_2CO_3, 19.0. Another table gives the tensile strength of an individual cotton fiber in H_2O and soda soln. at room temp. expressed in kg. The av. for 14 days was 12.2 for the untreated fiber, 13.1 for the fiber in H_2O and 12.8 for the soda soln. A cold soln. of the latter does not harm fibers but hot soda harms their elasticity and produces disintegration upon rubbing. Soap lubricates and protects fibers from disintegrating by hard rubbing. Sodium silicate acts in the same manner as Na_2CO_3. Fat solvents such as CCl_4 and turpentine oil are valuable and harmless aids in washing, but are not universally used because it is not possible to use them directly. There are soaps on the market which contain these ingredients such as "tetrapol" and "benzapol," contg. 15 and 12%, resp., of CCl_4 and "oxygon," contg. turpentine oil and a small amt. of soap. E. SCHERUBEL.

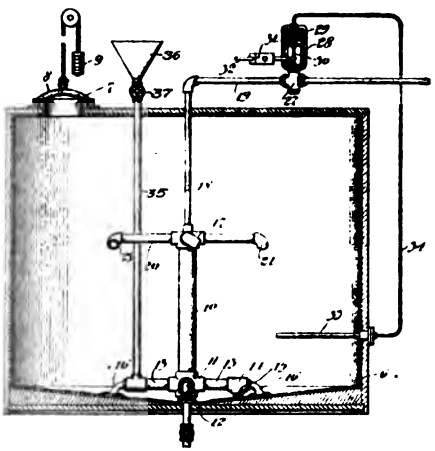
A new use for sugar (in soap). ANON. *Cent. Zuckerind.* 23, 853(1915); *Wochschr. Zentralver. Rübenzuckerind.* 53, 468.—Soap containing considerable amts. of sugar is claimed to wash satisfactorily some things previously considered to need chemical

Digitized by Google

bleaching (laborers' clothes in certain industries) and yet to be suited for delicate fabrics whose colors would not be fast to ordinary soaps. It may be used in weak salt water as well as soft water. The manner in which the sugar is used in the manuf. of the soap or the reasons for its particular properties are not given. W. L. BADGER.

U. S., 1,155,194, Sept. 28. E. R. BARROW. **Sterilizing and preserving cottonseed** for treatment in oil mills. The seed is treated with about 5% its wt. of NaCl containing in mixt. about 2% of starch and 2% of $MgCO_3$.

U. S., 1,156,905, Oct. 19. P. G. KAISER and B. E. REUTER. **Apparatus for treating fats and oils with steam.** Steam from the pipe *18* is forced into the pipe *10* and out into the oil or fat in the Pb-lined vat *6* through the whirling downwardly directed elbows *21*. The steam supply is automatically controlled by the pressure in the vat acting through the pipe *34* on the valve-control device *29*. *36* is a funnel through which saponification catalysts (*e. g.*, Twitchell reagent) may be added.



U. S., 1,156,068, Oct. 12. C. ELLIS. **A catalyzer for use in hydrogenating oils** is made by mixing Ni and Cu hydroxides with oil or glycerol and passing H through the mixt. while it is heated to 270–290° to reduce the metals.

U. S., 1,156,466, Oct. 12. R. CLAUS. **Preparing fullers earth for use in purifying edible oils, etc.** The crude fullers earth is formed into bricks, allowed partly to dry in the atm. and then treated with hot gases in a closed chamber (preferably at a temp. between 120 and 300°) to complete the drying. The bricks are then disintegrated.

U. S., 1,156,674, Oct. 12. C. ELLIS. **A catalyzer for use in hydrogenating edible oils, etc.,** is made by dissolving $Ni(OH)_2$ in an ammoniacal soln., mixing with finely divided charcoal, heating to drive off the NH_3 and H_2O and reducing with H. The charcoal is charged with H at the conclusion of the process.

Brit., 11,588, May 11, 1914. K. BIRKELAND. **Refining or distilling oils, fats** and other liquids by means of steam, H, or other vapors or gases, by forcing jets of the liquid through the steam, etc., into a body of the liquid, so that the steam, etc., is carried down into the body of the liquid, the resulting emulsion being then carried to a low-pressure receptacle in which the steam, etc., together with the impurities or vapors are disengaged. A suitable form of app. comprizes an autoclave from which the emulsion is led through a reducing valve in a pipe to a low pressure receptacle, which is furnished with a heating coil and communicates with a condenser and a vacuum pump. The liquid is forced by a pump through injectors into the upper part of the autoclave. Steam is admitted by a pipe. A screen is fitted to the autoclave to allow steam which is not thoroughly emulsified to rize to the surface. The process may be used for fractional distn., and the gas may be circulated by a suitable pump.

Brit., 14,571, June 17, 1914. S. MORGENSTERN. **Purifying fats and oils,** such as train oil, herring oil, or those obtained from bones, carcasses, sewage, fecal matter, refuse, etc., and rendering them available for use in the manuf. of **soap,** by heating them with the bases of alkali or alk.-earth metals in closed vessels at temps. above

Digitized by Google

150°. The proportion of base may be more or less than that required for saponification, and the heating is continued longer than is required for saponification. In an example, fat from fecal matter is heated with slaked lime in a closed autoclave for 6 hrs. at 200°, and the soap mass after being transformed with soda is used as household soap. The process is also applicable for the purification of the acids extd. from Russian petroleum by soda or other alkali.

Brit., 14,975, June 23, 1914. E. Burke. **A heavy metal salt of an org. acid is added to the paraffin wax used in mfg. candles. The Pb soap derived from oleic palmitic, or stearic acid may be used.**

Ger., 284,125, Nov. 15, 1913. C. Netz & Co. and F. Koch. **Defatting crude or worked fiber with fat solvents. The current of dry gas used for recovering the soln. remaining in the fibrous material after the extn. is mixed with regulable amts. of H_2O with a view to securing a fixed degree of moisture. The H_2O of condensation from the dry gas can be used for this purpose in order to return the suspended matter to the process.**

28. SUGAR, STARCH AND GUMS.

A. HUGH BRYAN.

Quantitative determination of *l*-glutimic acid in sugar house products. Vl. Stanĕk. Prague. *Z. Zuckerind. Böhmen* **39**, 191–7(1915).—S. proposes the following method for the quant. detn. of *l*-glutimic acid in sugar house products: Place 5 g. molasses or a corresponding amt. of any other sirupy product under exam. in a 200 cc. porcelain dish and add an amt. of approx. 50% H_2SO_4 (weighed in a small thin-walled glass dish or a capsule of Pb or Sn foil (*e. g.*, caps from wine bottles)) which is equivalent to the previously detd. alkalinity of the ash of the sample. Crush the small glass dish or flatten the Pb or Sn foil capsule and thoroughly mix the mass. Add an amt. of purified peat (*i. e.*, peat boiled with dil. HCl, washed with boiling H_2O until the test for HCl is no longer positive and extd. with Et_2O after being dried at 120°) equal to twice the wt. of the sample, mix thoroughly and transfer by means of glazed paper to the extn. tube of a Poupé extn. app. Remove the last traces of material from the porcelain dish by means of moistened wadding followed by the use of dry wadding. Add 0.5 cc. H_2O and a small crystal of $FeSO_4$ (in order to eliminate the influence of HNO_2 which may be present) to the flask (of approx. 300 cc. capacity) of the extn. app. and add sufficient Et_2O to the extn. tube to form a layer 2 inches deep above the mixt. Heat the flask in a H_2O bath and continue the extn. for 72 hrs. After the extn. is concluded distil the Et_2O and det. the N content of the residue by the Kjeldahl method, allowing the residue to remain in the original flask. One cc. of 0.1 *N* acid employed for titrating the NH_4OH which is produced is equivalent to 12.91 mg. *l*-glutimic acid. The purified peat may be used repeatedly by subsequently treating with boiling H_2O, drying and passing through a sieve. Expts. with an artificial molasses composed of 4 g. *l*-glutimic acid, 5 g. glutamic acid, 3 g. lactic acid, 1 g. AcOH, 1 g. formic acid, 5 g. betaine (the foregoing were first dissolved in H_2O and the soln. neutralized with KOH) and 50 g. sucrose in aq. soln. (final wt. of soln. was 100 g.) showed a recovery by the above method of 98.8–100.3% of added *l*-glutimic acid. Greater contents of sucrose than the above did not interfere with the extn. of *l*-glutimic acid by Et_2O and the method appears, therefore, to be applicable to sugar house products with a high quotient of purity. Expts. with aspartic acid and the leucine fraction (containing leucine, isoleucine and valine) from the hydrolysis of horn shavings indicated that the amino acids present in molasses do not form Et_2O-sol. products when the slightly alk. soln. of these sub-

Digitized by Google

stances is heated. The presence of Et_2O-sol. substances other than glutimic acid in molasses was not definitely disproved although S. did not succeed in isolating such a substance, except in 1 case in which a substance with N content equal to approx. 3% of the N content of the total Et_2O-sol. material was isolated; this substance probably consisted almost exclusively of glutamic acid. Molasses from the campaign of 1910–11 was found by this method to contain 5–7.8% glutimic acid as compared with 3–4.7% in samples from the campaign of 1911–12; this variation is probably dependent on the nature of the prevalent weather conditions during growth of the beets.

H. S. PAINE.

The degree of accuracy attainable in establishing constants for the double polarization method using acid or invertase. H. PELLET. *Intern. Sugar J.* **17**, 421–3 (1915).—P. finds that it is impossible to establish constants for the inversion of 1% sugar solns. showing differences within 0.06. This latter figure occurs as a difference in the table of constants worked out by E. Saillard as the result of expts. with the Ogilvie method of inversion. Using a 400 mm. tube, an error as great as 0.8 may occur when operating with a saccharimeter whose normal wt. is 16.29 g. and with one of 26 g., the error may be 1.3. A conformity of results cannot be expected because of differences in app. and methods of operation. To obtain satisfactory results it is necessary, (1) to carry out 2 or 3 expts. to establish the constants for solns. giving sensibly the same polarization as the liquid under analysis, (2) similarly to make 2 or 3 detns. upon the liquid under analysis, (3) to employ the same calibrated flasks and also the same pipet, (4) to utilize the same saccharimeter tube placing it in the same position for every reading, and (5) to arrange the cover glasses always in the same position (marking them to assure this).

A. GROSS.

A study in the chemical control of cane sugar factories. II and III. N. DEERR. *Intern. Sugar J.* **17**, 407–11(1915).—A continuation (cf. *C. A.* **9**, 2991). A detn. and comparison of the values of the grav. solids, refractive solids and abs. solids, these terms being used by D. to denote the "solids" correspondingly, resp., to the degree Brix, to the refractive index and to the dry substance. A selection of the results obtained given in 4 tables shows that the order of magnitude is regularly, (1) grav. solids, (2) refractive solids, (3) abs. solids, and that the differences are fairly well maintained. The detns. of molasses were made at a concn. of about 12% abs. solids and the results indicate that the relative values of the degree Brix and the abs. solids of a molasses referred to the original concn. show a wide divergence, depending on the concn. at which the grav. solids are detd. This fact follows from the results noted in the previous paper (*l. c.*) which show that the grav. solids when calcd. back to the original concn. vary with diln. Here very possibly lies the cause of the apparent discrepancies which will be noted by anyone who has compared the results recorded by a group of factories. The solids balance is given as the comparison of the quantities, (*a*) wt. of raw juice × % solids, and (*b*) wt. of molasses × % solids + wt. of raw sugar × % solids + wt. of press cakes × % solids. The meaning of this balance offers no difficulty when referred to the abs. solids, but is likely to be confusing and indefinite when referred to the grav. or refractive solids. Some rational concn. applicable to all products must be fixed for this detn.; it appears *a priori* to be one at which the concn. of the nonsugars is the same in all the products under examn. When detd. under this condition there should be an exact balance of the grav. and refractive solids as between a juice sepd. into raw sugar and molasses. As the result of expts., D. feels justified in suggesting that the grav. solids and refractive solids balances of the cane sugar house be referred to the detn. of juice, raw sugar and molasses in an equal concn. of nonsugar. The results of an attempt to obtain a rational solids balance in a certain sugar house on the basis as developed by D. are given in detail.

A. GROSS.

The making of sugar in Louisiana with special reference to white sugar. IV. C. E. COATES. *Louisiana Planter* **55**, 186–8(1915); cf. *C. A.* **9**, 2992.—C. finds in the various centrals, a lack of means for making careful estimates of the actual wts. of satn. water, dil. juice and of the cane fed to the mill. As calcns. are still largely used for this purpose, formulas based on the work of Prinsen-Geerligs, Deerr and others are given. On the subject of satn., C. agrees with Pellet in a number of his conclusions (*C. A.* **9**, 1132, 1701), but believes it better practice to get the satn. water on the bagasse as soon as possible. It was found difficult to break the blanket to let the water get at the lower layers (as suggested by Pellet) and rearrange it for a regular feed to the next mill. Hot satn. water is considered best for low fiber cane. A. GROSS.

Five years of beet sugar manufacture. L. RADLBERGER. *Oesterr. Chem. Ztg.* **18**, 120–4(1915).—R. discusses the progress made in the beet sugar manuf. from the economic, technologic and analytical standpoints. ARTHUR LEDERER.

The purity of the sirup adhering to raw sugar. TH. KOYDL. *Z. Ver. Zuckerind.* **65**, 226–9(1915).—Herzfeld found (cf. *C. A.* **9**, 1853) purities of 58.1 to 76.5, av. 66.8, by his method (washing with satd. sugar soln., cf. *C. A.* **6**, 1548). K. finds, by detns. by his alc. method extending over 10 yrs., purities from 57 to 78, av. 66.1. The supersatn. coeffs. calcd. from H.'s data range from 1.03 to 2.34, av. 1.51; by K.'s method they range from 1.04 to 1.16, av. 1.11. No explanation is offered for the coincidence of the methods on purities and their divergence on supersatn., except that figures for supersatn. from both methods involve calcns. which tend greatly to increase the exptl. error in the original detns. K. repeats that though the crystal content of raw sugars does not directly det. the refinery yield, yet it runs so nearly parallel to the yield that it should serve as a method of accounting in the refinery after the detn. of the proper coeffs. W. L. BADGER.

Experiments on the continuous centrifugal clarification of refinery liquors. J. HAMILL. *Intern. Sugar J.* **27**, 419–20(1915).—The inventor claims that his machine successfully collected and discharged impurities at the desired points while in operation at full speed. A. GROSS.

The development of the cane mill in Cuba. JAMES H. DOD. *Louisiana Planter* **55**, 168–70(1915).—A history of the different types of cane mills. A. GROSS.

Short notes from practice. Results of analyses of molasses from Bulgarian sugar factories. C. D. MANZOFF AND M. NICOLOFF. *Z. Nahr-Genussm.* **30**, 101 (1915). LOUIS D. ELLIOTT.

Ammonia as a by-product in sugar factories. ED. DONATH. *Oesterr. Chem. Ztg.* **18**, 112–4(1915).—D. discusses the sources of NH_3 in the various stages of beet sugar manuf. and the patents aiming at its economic production from these sources. The problem is yet unsolved. ARTHUR LEDERER.

Saccharification of starch by hydrofluoric acid. EDUARD KUNZ. Tech. Hochschule, Munich, 1913, *Dissertation;* through *Z. Spiritusind.* **38**, 297–8, 306(1915).—The paper may be summarized as follows: The inverting power of HF is only $^1/_{17}$ of that of HCl. At low HF concns. and boiling under atm. pressure, a higher sugar degree is obtained only after an unproportionate length of time. Increase of pressure and consequently of b. temp. shortens the time, but favors on the other hand the decompn. of the sugar formed. Increasing the acidity results in a rapidly increasing decompn. and reversion of dextrose. HF, therefore, is much less suitable for the starch inversion than the acids commonly employed, especially HCl and H_2SO_4. L. W. HAAS.

Is the "stiffening" (of starch) an equilibrium process controlled by mass-action? J. R. KATZ. *Verslag Akad. Wetenschappen* **23**, 1150–9(1915).—Further expts. were

Digitized by Google

carried out on the properties of wheat starch with respect to water. The results obtained lead to the conclusion that the swelling and stiffening of starch in water is an equil. process, the limiting condition thus depending on the temp. and on the relative amt. of H_2O present. L. H. ADAMS.

Cement for polarimeter tubes (PATTERSON) 1. Device for emptying centrifugals (EBERHARDT) 1. Use of sugar in soap 27. Explosibility of sugar dust (WHEELER) 24. Refractories for lime kilns and pulp driers (RICHTER) 19. The sugar beet and the products derived from it as raw materials for bread making (NEUMANN) 12. Brit., 13,602, June 4, 1914. E. SHAW. App. for **concentrating sirups,** etc.

Brit., 13,364, May 30, 1914. J. C. GRIERE. In **sugar manufacture,** a continous process for the direct conversion of a soln. of sugar or similar substance or a massecuite containing crystals into a dry and friable product consists in treating a supply of hot concd. soln. with a supply of friable pptg. substance regulated according to the quantity and concn. of the soln. supplied. The pptg. substance may be derived from the partially finished product, or it may be sugar in grains or a foreign substance such as kieselguhr, sand, alumina, or powdered boneblack. The foreign substance may be left in the finished product, or may be sepd. by any known method when the sugar is remelted. The hot paste so formed is then subjected to a kneading process and afterwards treated in primary and secondary drying appliances. In the primary drying app., the mass is agitated and exposed to the action of hot air partly satd. with moisture, while in the 2nd app. the mass is subjected to energetic agitation and mixing and to the action of cold air. The mass may be sifted between the 2 drying operations, and may be further heated by a current of hot air before sifting. After drying, the product is treated with moist air to give it its natural amt. of hygroscopic moisture and is simultaneously cooled. This may be carried out by allowing the product to fall over refrigerating surfaces, on which moisture from hot moist air passing through the app. is allowed to condense. The process may be varied by compressing the paste received from the kneading app., the moist blocks so formed being dried in a current of cold air or *in vacuo*. The process may also be modified by introducing at any stage a decomposable solid or liquid or a gas for the purpose of varying the compn., taste, or color of the final product. The raw soln., after being treated in a concen-

Digitized by Google

trator supplied with heating steam under const. pressure, passes to a regulating chamber fitted with a weir so shaped that the flow is directly proportional to the height of liquid above the weir. The regulating chamber is further provided with a float adapted to operate the valve controlling the supply of soln. to the concentrator and also to control the rate of delivery of the pptg. material.

29. LEATHER AND GLUE.

LLOYD BALDERSTON.

The tannery fifty years hence. J. R. BLOCKEY. *Leather Trades' Year Book* 1915, 186–93; *J. Am. Leather Chem. Assoc.* 10, 489–95(1915).—Forecast of probable lines of progress. L. B.

Dressing of wool and hair rugs. H. BRUMWELL. *Leather Trades' Year Book* 1915, 157–60; *J. Am. Leather Chem. Assoc.* 10, 496–9(1915).—The substitution of neradol tannage for alum "tawing" gives a more water-resistant product, and one which is in no respect inferior to that produced by the older process. L. B.

Impressions of Dutch West Borneo. A. T. HOUGH. *Leather Trades' Year Book* 1915, 117–27; *J. Am. Leather Chem. Assoc.* 10, 499–506(1915).—Manufacture of tanning extract from mangrove bark is described. L. B.

Dry glue or liquid glue? E. SAUER. Memmingen in Bay. *Kolloid-Z.* 16, 148–50(1915).—Since more than half the cost of manuf. of glue comes in drying out the 40% gel it would be advantageous to manufacturer as well as consumer if liquid rather than dry glue were put on the market. The objection to this is that the quality of a liquid glue cannot be detd. by inspection as that of dry glue can. To overcome this objection it would be necessary to label the liquid glue with the % of dry glue and regulate the price accordingly, and to give the binding power (in terms of viscosity or m. p.) of the dry glue. H. I. MATTILL.

The newer tanning theories. R. LAUFMANN. Freiberg. *Kolloid-Z.* 17, 37–44 (1915).—A review. H. I. MATTILL.

The biological testing and evaluation of tanning materials. R. KOBERT. Univ. Rostock. *Ber. pharm. Ges.* 24, 470(1914); *Collegium* 1915, 321–31.—The procedure followed embodies the use of 2–5% suspensions of several kinds of blood, as also 1–2% suspensions of serum-free blood corpuscles and others of low serum content. Ordinarily, batteries of 7 test tubes were prepd., each containing 5 cc. blood or corpuscles. For control purposes test tubes 1 and 7 contained in addition 5 cc. physiol. NaCl soln., while the remaining 5 were given mixts. of tannin (or tanning material) and physiol. NaCl soln. amounting to 5 cc. for each tube. After being tipped once, the tubes are allowed to stand at room temp. not longer than 24 hrs., whereupon results are noted. It was shown that if the tannin is present in quantity just sufficient to exercise a max. of activity, it disappears completely from the liquid itself, agglutination having taken place, thereby yielding a colorless liquid on filtration. In the case of Merck's tannin, a 1% suspension of blood corpuscles effected complete agglutination within 24 hrs. in dilns. of 1:25000, while with oak bark tannin a diln. of 1:20000 produced a like result. During this process the tannic acid is changed into gallic acid. The ability to hydrolyze tannic acid is inherent in the cells of various organs, particularly those of the intestinal mucosa and in a high degree. Since gallic acid itself effects agglutination, the procedure indicated above may be employed to det. approx. the tannin in any tanning material. Similar results were noted in the case of eutannin, the tannic acids of pomegranate, areca, logwood and rhatany. An examn. of the artificial tanning

Digitized by Google

material neradol D. in acid soln. showed differences in behavior toward serum-free blood corpuscles, depending on the quantity added. Either hemolysis without decoloration and formation of a ppt., or agglutination with or without partial hemolysis and production of grayish flakes, or finally total agglutination with no intermediate stages resulted. The clear supernatant liquid reacted with $FeCl_3$ but not with gelatin. In non-neutralized solns. hemolytic activity of neradol attains a limit in dilns. of 1:12500 while its agglutinative power is limited to 1:2000; in neutralized solns. the limit of diln. for hemolysis is 1:20000, all calcd. to the dry substance, which constitutes 50% of neradol, about 33% consisting of tanning material. Neutralized neradol effects complete hemolysis in both large and small doses, thus behaving more like the saponins than the non-neutralized product, which ppts. serum, though in less degree than tannin. Neutralized neradol has no effect on serum. It is only slightly toxic, resembling in this respect certain phenols. W. O. E.

Gravimetric determination of tannic acid in tanning materials. A. Gawalowski. *Z. anal. Chem.* **54**, 403–5(1915).—The substance is first extd. with EtOH and Et_2O, giving a soln. containing the tannic acid and resin. Evap. an aliquot portion of the ext. to dryness, ext. with H_2O, ppt. the resulting tannic acid with $Cu(AcO)_2$ soln. and collect the ppt. on a weighed filter, dry and weigh. Ignite the ppt. in air or O, reduce the CuO with H; calc. the wt. of tannic acid from the wt. of total ppt. and wt. of Cu, correcting for the H atoms replaced by Cu. Hager's CuO factor for tannic acid is not admissable; G. finds factors ranging from 1:24 to 4.25 for various materials. George W. Morey.

Stickelberger, E.: **Versuche e. Geschichte der Gerberei.** Berlin: J. Springer. 95 ss. 8 M.

U. S., 1,154,762, Sept. 28. J. J. Gross. **A tanning composition from waste sulfite liquor** is made by treating the liquor while warm with HCl and H_2SO_4 and adding K_2CrO_4 to ppt. remaining Ca from soln., concg. the purified soln. to about 20° Bé., cooling it with air, filtering from the ppt. thus formed and further concg. to any desired consistency. A product of 30° Bé. contains about 32% of tanning substances.

U. S., 1,157,952, Oct. 26. J. Moszynski. **Tanning leather.** The hides are immersed in a bath of H_2O containing cutch ext. 10 lbs., and chestnut ext. 10 lbs. reduced to 25° "barkometer," then in H_2SO_4 of 30° "bkm." for 3 days and then replaced in a bath of cutch and chestnut exts. of the original strength at first, the strength afterward being increased by addition of fresh ext. Then they are placed in a 25° Na_2CO_3 soln. at a temp. of about 52° for 15 min., then in 30° H_2SO_4 and finally treated with cold H_2O, dried and H_2O-proofed.

Brit., 14,868, June 20, 1914. Anhydrat-Leder-Werke Akt.-Ges. and K. Haring. In the **impregnation of fabrics,** the principle of the process of 28,392, 1912 (*C. A.* **8**, 1886), for introducing molten material of considerable viscosity into prepd. skin and finished leather, is applied to fibrous material of any kind. Felt, or a woven material of wool, cotton, hemp, linen, jute, or the like may be used, a substitute for sole leather for making driving belts, a material for excluding H_2O, or an elec. insulating material being obtained. The process consists in impregnating the fabric with a soln. of a suitable filling material and then introducing the satd. fabric into a fused mass adapted to be dissolved in the solvent used in the soln. Asphalt, petrol goudron, resin, caoutchouc, gutta-percha, and paraffin of high m. p. are mentioned. Linseed oil varnish may be added to produce a gradual hardening effect. Benzene is mentioned

Digitized by Google

as a solvent. To impart additional solidity the fabric may be impregnated with a soln. of cellulose, such as celluloid, cellite, or acetylcellulose. Cf. *C. A.* 9, 725.

Published by the American Chemical Society, Easton, Pa.

Entered as Second-class Matter at the Post-Office, Easton, Pa.

Communications for the Editor should be addressed to E. J. Crane, Ohio State University, Columbus, Ohio.

The Council have voted that no claims for copies lost in the mails can be allowed unless such claim is received within "sixty days" of the date of issue, nor if due to failure to give sufficient notice of change of address. Charles L. Parsons, Secretary

Remittances for annual membership dues or for subscriptions, changes of address, orders for subscriptions or back numbers, claims for missing numbers, and all matters intended for the Proceedings should be sent to the Secretary, Charles L. Parsons, Box 505, Washington, D. C.

Secretary's Office, Box 505, Washington, D. C.

The American Chemical Society

The Board of Directors of the American Chemical Society has fixed the following schedule of prices for its publications:

Subscription Rates

Journal American Chemical Society	$ 6.00
Chemical Abstracts	6.00
Jour. Industrial and Engineering Chemistry	6.00
Two Journals to same address	10.20
All three Journals to same address	12.60

Back Numbers and Volumes		To Members	To Non-members
Single Numbers: J. A. C. S.; J. I. E. Chem. or Chem. Abs...		0.50	0.60
Back volumes	Proceedings, Vol. 1 (1876); Vol. 2 (1877).....	2.00	2.50
	J. Am. Chem. Soc., Vols. 1–16 inclusive, each....	4.00	5.00
	J. Am. Chem. Soc., Vols. 17–37 inclusive, each....	5.00	6.00
	Chem. Abs., Vol. 1, 2, 3 or 5 complete, each.....	10.00	12.00
	Chem. Abs., Vol. 4, 6, 7, 8 or 9 complete, each....	5.00	6.00
Index to Vols. 1–20, J. Am. Chem. Soc.....		0.50	0.75
Index to Chem. Abstracts, Vol. 1, 2, 3, 4, 5, 6 or 7.....		1.00	1.00
Jour. Ind. and Eng. Chem., Vols. 1–7.....		5.00	6.00

Foreign Postage, each Journal 75c.; Chemical Abstracts, $1.00 a year.

Special Discounts to Newsdealers, Libraries and Institutions of Learning

Complete sets, Vols. 1 to 35, of the Journal; Proceedings, Vols. 1 and 2, and Vols. 1 to 7 of Chemical Abstracts may be had of the Secretary.

The following numbers can be furnished only in complete sets, *viz:* J. Am. Chem. Soc., **17** (1895), 1 and 8; **18**, 5; **19**, 1; **20**, 3; **22**, 3.

Besides the above, the following numbers can be furnished only in complete volumes, *viz:* J. Am. Chem. Soc., **26**, 4; **29** (1907), 4; **30** (1908), 2, 3, 4, 5, 6 and 7; **33**, 3, 4 and 9; **34**, 9, 10 and 11; Chemical Abstracts, **1** (1907), 3, 12, 13, 14, 15 and 16; **2** (1908), 1 and 2; **5**, no numbers except 1, 4 and 6; Jour. Ind. and Eng. Chem., **1**, only No. 11; **3**, Nos. 3 and 12; **4**, Nos. 3, 4, 5, 7 and 10; **5**, No. 1.

Advance payment is required and should be made by check or money order only. Stamps not wanted.

The Council has voted that the Secretary shall honor claims for non-receipt of publications only if made within sixty days of their issue. Claimants must also directly state that the publication was not delivered at their recorded address. "Missing from files" is no proof of non-receipt.

The Society will not be responsible for loss due to change of address unless notification is received one week in advance of issue.

Members or subscribers desiring their Journals or Abstracts forwarded from an old address should always notify their Postmaster and leave necessary postage.

The names of members and subscribers, whose Journals or Chemical Abstracts cannot be delivered by the Post-Office Department, will be cut off the mailing list at once, and will not be restored until correct addresses have been furnished.

In the absence of other information, the notices of change of address received from the Post-Office Department will be considered as correct, and the mailing list changed accordingly.

All communications should be addressed to

CHARLES L. PARSONS, Secretary,
Box 505, Washington, D. C.

CHEMICAL ABSTRACTS

Volume 9, No. 24 **1915**

I. AUTHOR INDEX.

("P" before a page number indicates "Patent.")

NOTE—In the transliteration of names originally written in Russian, the system followed so far as possible is that of *Nature* (Feb. 27, 1890), in which *v* is used instead of the *w* or *ff* of other spellings, *sh* instead of *sch*, *ch* instead of *tsch*, *i* instead of *j* or *y*, etc. Thus Pavlov, not Pawlow; Chugaev, not Tschugaeff. To make quite sure, users of the index should in such a case look under both spellings.

II. SUBJECT INDEX

All new compounds are entered in the index. Esters and salts of organic acids are generally indexed under the name of the acid; formates, acetates and oxalates are exceptions.

In the case of most entries a word or phrase characterizing the general heading is given. Chiefly to facilitate locating subjects this is followed by the author name (only the first in case there is more than one author). A semicolon after the page number refers the following entry back to the paragraph heading. If there is no punctuation mark in this place it is to be understood that the preceding characterizing word or phrase applies also to all following entries until the occurrence of a semicolon.

Abattoir, paper material from 714.

Abderhalden reaction and antitrypsin method (Freund) 92; substratum in application of dialysis method (Lindig) 92; criticism of dialysis method and protective enzyme reaction (Oeller) 92; (Ross) 92; significance in psychiatry (Urstein) 99; in cancer (Ball) 214; (Otto) 215; pregnancy (Eder) 220 (Dejust) 1803; in tuberculosis of lungs (Ammenhauser) 221; decomp. of thymus and lymph glands in (Beumer) 221; in carcinoma (Fasiani) 334; in helminthiasis (Manvilov) 334; differentiation between bacteria by (Kirschbaum) 471; effect of cholesterol on (Lindemann) 481; value (Csepai) 481; freedom from blood of substrata and sera used in (Fetzer) 919; serum proteases and mechanism of (Jobling) 920; mechanism of (Bronfenbrenner) 920; with liver tissue in alcoholics (Martini) 930; results with lung tissue (Melikjanz) 1348; rationale of (McDonagh) 1504; (Ebeler) 1639; and protective enzymes of blood after transplantation of organs (Goodman) 1640; serum antitrypsin in (Bronfenbrenner) 1924; nature of (Bronfenbrenner) 2100 (Kochnev) 2106; clinical studies (Steiner) 2105; (Ross) 2266; (Thar) 2939; (Pregl) 3263; modification (Bronfenbrenner) 3267; (Van Slyke) 3289; (Bronfenbrenner) 3292; modified by Pregl (Crinis) 3294; see also *Dialysis; Pregnancy.*

Abdomen, use of oil in (Burrows) 2553.

Abietic acids (Pooth) 2644.

Abrasives, art. (Hawke) 695; coating metal, wood, etc., with (Bullock) P 1373; carborundum (Carter) P 1836; sheet paper or cloth (Virneburg) P 1977; fused Al_2O_3 (Kalmus) P 2489; see also *Polishing materials.*

Abriachanite (Murgoci) 2046.

Absorbents packing-material for C_2H_2 (Wilkinson) P 371, 2146; for galvanic batteries (Rabbidge) P 563; (Aktiebolaget Kolm) P 698; for foul gases and for decolorizing sugar juices (Hellsing) P 849; for removing CO_2 from air (Cadman) P 3337.

Absorption of granulation tissue and fat-free tubercle bacilli (Hirsch) 106; of H_2O by building brick (Mahr) 139; of gasoline vapor in natural gas by H_2SO_4 (Anderson) 142; transpiration stream and, of salts (Hasselbring) 475; pancreas in glucose (Körösy) 645; pancreatic juice in fat (Terroine) 645; of protein and fat after resection of 1/2 of small intestine (Palmer) 646; of Wassermann reaction antibody by organ emulsion (Mundt) 822; of water by gypsum (Calderon) 902; subcutaneous, of cholesterol (Corper) 928; alc., by animal organs (Votz) 937; O, of linseed oil (Darner) 970; biol., of H_3PO_4 in soils (Dushechkin) 1085; refrigerating machine (Mehlhope) P 1138 (Reitz) (Altenkirch) P 1139; of liquids in seeds of *Lupinus albus* (Traverso) 1189; of O by coal (Winmill) 1382; NH_3, processes (Ormandy) P 1375; of H by Na-K electrodes (Gowdy) 1419; of water through skin of frog (McClendon) 1488; of digitalis substances in heart (Issekutz) 1511; power of $MgCO_3$ for volatile products (Maranne) 1530; I, of oil of anise (Morin) 1531; drug, in frogs (Baker) 1533; detg. O, of drying oils (Waele) 1551; art., of liquids in plants (Acqua) 1799; fat and protein in normal and depancreatized animals (Cruickshank) 1800; of fat and protein in typhoid fever (Coleman) 1801; Physiology and Pathology of Water, in Living Organisms (Fischer, book) 1805; of cations and anions by soil (Dominicis) 1960; Die Absorptionsfähigkeit der Boden (Rohland, book) 1963; of lipocolloids in plasma membrane (Czapek) 2102; of H in quartz glass (Wüstner) 2031; of SO_2 by wine (Omeis) 2123; HNO_3, towers 2130; of gas residues in Röntgen tubes (Cardani) 2188; sp., of reagents for gas analysis (Anderson) 2199; of Cl as criterion of quality of waters (Zaleskii) 2275; machine (Altenkirch) P 2332; of fats by mussels (Churchill) 2404; packing for, towers (Raschig) P 2433; NH_3-, app. (Vogt) P 2472; of ions by roots (Johnson) 2662; protein, and cancer (Beveridge) 2776; of drugs from nasal submucosa of dogs (Pilcher) 2779; of fertilizing substances in diff. growth phases of sugar beet (Calzolari) 2789; lime for, of nitrous gases (Norsk Hydro-Elek., etc.) P 2803; of rarefied nitrous gases in water (Häusser) P 2804; antagonism between ions in, of salts by plants (Stiles) 2961; of air by charcoal at low temp. (Knipp) 2997; intestinal, of albumin in newborn and in infants with intestinal affections (Lawatschek) 3096; of vegetable tan-stuffs by plumped hide (Kudlacek) 3143; automatic balance in study of enzyme reactions accompanied by, of gases (Abderhalden) 3255; of I by dog thyroid (Marine) 3281; of Fe from organs after hemolysis (Muir) 3289; see also *Absorption of rays.*

Absorption, of rays; of ultraviolet rays by Cl deriva. of CH_4 (Massol) 10; of solar radiation

Digitized by Google

by atm. (King) 13; of light by water changed by presence of hydrated salts (Schaeffer) 13; 2-dimensional (Schaefer) 15; coeffs. of X-rays (Bragg) 21 (Moore) 2486; and wave length for X-rays (Siegbahn) 175; const. of quartz (Coblentz) 409; measuring, of light (Rice) 550; of cathode rays (Mayer) 554; demonstrating Kirchoff's law of (Tumlirz) 873; of light and fluorescence (Baly) 1001; Zeeman and Winawer magneto-optical, effect (Voigt) 1002; of hard X-rays—, measurements (Winawer) 1148; relation between certain X-ray wavelengths and their absorption coeffs. (Bragg) 1429; relation between, of light and structure (Ismail'skii) 1471; of Röntgen rays (Kossel) (Kirschbaum) 1715; in Pb of γ-rays (Richardson) 1875; of β-rays (Varder) 1875 (Sanford) 2735; of ultraviolet and infra-red rays by arable soil (Tristan) 1960; of ultraviolet radiation by O (Warburg) 2480; infra-red and ultraviolet, and variation in, with conc. (Baly) 2729; Ueber den Energieumsatz bei photochemischen Vorgängen in Gasen—Absorption ultravioletter Strahlung durch Sauerstoff (Warburg, book) 2836; theory of (Baly) 3163; see also *Light; Spectrum, band (absorption)*.

Absorption bands. See *Spectrum, band (absorption)*.

Absorption spectra. See *Spectrum, band (absorption)*.

Acacia, detg. Cr in presence of (E'We) 513.

Accelerators. See *Catalysers*.

Accidents in chem. ind. (Groszmann) 2698; prevention of, in chem. ind. (Keough) 3332.

Accumulators, impurities in Pb, electrolyte (Weightman) 268; Edison storage batteries for radio-service (Hutchinson) 890; 1007; isolated plants (Beckmann) 1433; voltage regulation (Redding) 1877; charging (Miles) 1878; Pb poisoning in manuf. of (Hamilton) 1878; patents on (B.-N.) 2190; smelting storage-battery sediment (Smith) 2210; effect of porosity on capacity of storage batteries (Heim) 2839; *Patents:* (Poole) 26; (Holmes) (Hutchinson) 27; alk. (Foss) 29; filling (Sablon) 269; (Hodge) (Drambourg) (Wilson) 563; (Davis) (Snyder) 759; grid structure (Knobloch) 1011; prepg. separators (Skinner) 1011; (Hurley) 1584; (Ford) 2626, 2741; (Willard) 2740; (Walker) 2741; neutralizing fumes from (Murray) 1585; (Morrison) 1585; (Luthy) (Chamberlain) 1879; (Redding) 2191; (Clouth, G. m. b. H.) (Fab. Elek. Zünder) 2192; regenerating Pb sulfated batteries (Palmer) 2352; container for (Achenbach) 2353; (Crowdus) 3175; see also *Electrode; Grid*.

Acenaphthene (Ges. für Teerverwertung) P 523.

Acenaphthylene and derivs. (Campbell) 2761.

Acetaldehyde formation from aliphatic acids by photocatalysis (Neuberg) 58; formation from ethylene glycol, etc. (Neuberg) 58; decomp. of succinic and α-crotonic acids to (Neuberg) 59; transformation of fumaric, etc., acids into (Neuberg) 59; formation in alc. fermentation (Buchner) 94 (Neuberg) 303; from waste gases in sulfite pulp mills (Bergström) 149; manuf. (Consortium, etc.) P 355 (Behrens) P 356 (Snelling) P 693 (Duden) P 2796; utilization by yeast (Kostychev) 471; 4,4'-diphenylsemicarbazone (Toschi) 2388; in latex of *Hevea brasiliensis* (Kerbosch) 2607; 2-quinolylhydrazone (Fargher) 2890; 2-pyridylhydrazone (Fargher) 2890.

Acetaldol (Matheson) P 2795.

Acetals, prep. of, of glyoxals (Dakin) 201; prep. of ethers from aldehyde and ketone, and Mg org. compds. (Chichibabin) 1751.

Acetamide, solubility in system C_6H_6– (Moles) 743.

4-Acetamino-3-amino-1-naphthol hydrochloride (Kehrmann) 625.

***p*-Acetaminobenzeneazo-2'-bromo-4'-diethylaminobenzene** (Jacobs) 2073.

***p*-Acetaminobenzeneazodiethylaniline** (Jacobs) 2073.

***p*-Acetaminobenzeneazodipropylaniline** (Jacobs) 2073.

***p*-Acetaminobenzeneazoethylbenzylaniline** and amino deriv. (Jacobs) 2073.

Acetaminobenzyl chloride, *o*- and *p*-, compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

2-Acetamino-3,5-dinitrotoluene (Körner) 3218.

1-Acetamino-4-ethoxychloroacetylbenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.

***p*-Acetaminoiodoacetylbenzylamine** and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.

3-Acetamino-2-methoxytoluene, nitration of (Simonsen) 2518.

3-Acetamino-4-methyl-ω-iodopropiophenone and deriv. (Jacobs) 2077.

3-Acetamino-4-methylphenacyl bromide and deriv. (Jacobs) 2077.

***p*-Acetaminophenacyl bromide** and deriv. (Jacobs) 2077.

Acetaminophenoxyethyl bromide, *o*- and *p*-, and derivs. (Jacobs) 2076.

***p*-Acetaminophenyl bromomethyl ketone** and deriv. (Jacobs) 2077.

Acetaminophenyl diselenide (Pyman) 2889.

(*p*-Acetaminophenyl)methylarsinic acid (Bertheim) 1338.

Acetaminophenylselenious acid (Pyman) 2889–90.

Acetaminopropiophenones, α- (Bachstez) 629; β- (Gabriel) 2876.

3-Acetamino-5-thiotolene-4-carboxylic acid (Benary) 1785.

3-Acetamino-4-tolyl bromomethyl ketone and deriv. (Jacobs) 2077.

3-Acetamino-4-tolyl ω-iodoethyl ketone and deriv. (Jacobs) 2077.

Acetanilide, prepn. (Häussermann) 510 (Kausser-

Digitized by Google

mann) 2288; volatility in steam (E'We) 513; tautomerism of (Valyashko) 2071; history of (Sharp) 2691.

Acetatemercuri compounds of the pyrazolone series (Schrauth) 304.

Acetic acid, ebullioscopic behavior of solvents at diff. pressures (Beckmann) 7; phys. properties of alkyl esters (Kenyon) 64; manuf. (Consortium, etc.) P 355, 2424 (Bayer & Co.) P 1280, 1370; by-product in manuf. of (Yanagisawa) 509; effect of diln. on H potentials of (Walpole) 999; H potentials of mixts. of NaOAc and (Walpole) 999; from C_2H_2 (Hansen) P 1095; from $Cd(OAc)_2$ (Adler) P 1098; system: Pb oxide–H_2O–(Sakabe) 1284; sepn. from HCO_2H (Heuser) 1444; viscosities of binary mixts. of, with H_2O and HCO_2H (Davis) 1568; mol. complexity of (Bennett) 1571; Hg-org. salts of (Jacobs) 1610; and formation of $AcNHC_6H_4CO_2H$ in organism (Hensel) 1640; elec. resistance of (Johnstone) 2337; concg. (Anilin-Fab.) P 2425; use of cyanic acid in glacial soln. (Bailey) 2530; bromination of phenanthrene in glacial (Sandqvist) 2543; detg. formic acid in presence of (Lauffman) 2632; effect on consts. of butter fat (Bahlman) 2676; prepn. (Farbw.) P 2796 (Griesheim-Elek.) P 3330; utilization of, produced by oxidation of linseed oil (Fritz) 2988; influence on synthesizing and hydrolyzing properties of α-glucosidase (Bourquelot) 3070; estg. in vinegar (McLaughlin) 3104; see also *Aluminium acetate, ethyl acetate, etc.; Fermentation.*

Acetic anhydride, ebullioscopic behavior of solvents at diff. pressures (Beckmann) 7; action on benzylideneanthranilic acids (Ekely) 1064; manuf. (Peski) P 1534 (Gen. Chem. Co.) P 2568 (Kaufler) P 2796 (Müller) P 3118; action on morphine alkaloids (Tiffeneau) 1747, 1912; behavior of thiourea and urea toward (Kohmann) 2654.

Acetoacetanilide - *p* - carboxylic acid (Bayer & Co.) P 865.

Acetoacetic acid formation in liver (Loeb) 926; and formation of $AcNHC_6H_4CO_2H$ in organism (Hensel) 1640; chromoisomeric salts of compds. resembling the ester (Hantzsch) 2243; 4,4′ - diphenylsemicarbazone of Et ester (Toschi) 2388; condensation of acid chlorides with Et ester (Bradshaw) 2517; site of manuf. in the organism (Derham) 2668; Gerhardt's reaction for (Lichtwitz) 2770; 2-quinolylhydrazone of Et ester (Fargher) 2890; prep. of Et ester (Scarborough) 2895; removal from urine (Graham) 3080.

Acetoacetic nitrile phenylhydrazone, and benzylphenylhydrazone (Mohr) 61.

Acetochloromaltose (Born) 2249.

5-Acetochloronitroanilines (Bamberger) 1783.

Acetosevernone (Hoesch) 2541.

Acetoform, 954.

Acetohomovanillic acid . . . 1053.

Acetohomovanillin and *p*-nitrophenylhydrazone (Harries) 1053.

Acetolysis of carbohydrates (Born) 2249.

Acetomethylnaphthindazole (Witt) 804.

Acetonaphthols, rearrangements in group of, and derivs. (Witt) 803.

Acetone from waste gases in sulfite pulp mills (Bergström) 149; mol. wt. in freezing CCl_4 and $CHCl_3$ (Beckmann) 746; vapor tension of acetone-$CHCl_3$ and temp. (Beckmann) 747; estn. of Al by action of AcCl in (Minnig) 771; estn. of (Leaming) 899; pancreatic organotherapy and ketogenesis (Kirk) 926; expansion of mixts. of CS_2 and (Varona) 994; in com. $CHCl_3$ (Dorronsoro) 1223; condensation with glycerol (Irvine) 1468; influence of salts on equil. in system: water– (Jacobs) 1563; storing C_2H_2 dissolved in (Dalen) P 1840; system: caoutchouc–C_6H_6– (Caspari) 1868; detg., in urine (Sobel) 1927 (Engfeldt) 2100, 2548; form of diabetic coma not due to "acetone bodies" (Rosenbloom) 2107; extg. egg yolks with (Fendler) P 2291; 4,4′-diphenylsemicarbazone (Toschi) 2388; prep. of dichlorodinitromethane by simultaneous nitration and chlorination of (Rakshit) 2765; manuf. (Petrillo) P 2797; 2-pyridylhydrazone (Fargher) 2890; formation from propylene glycol, etc. (Neuberg) 3058; as precipitant of albumin (Gottlieb) 3080; influence when injected into plants (Ciamician) 3271; from sugar (Bayer) P 3326.

Acetoneberberine (Freund) 2874.

Acetone-bisulfites as phot. developers (Pellizzari) 272.

Acetone - *p* - bromophenylhydrazone peroxide (Busch) 806.

Acetonedicarboxylic acid, transformation of ester lactone from (Leuchs) 1060.

Acetone diethylacetal (Claisen) 629.

1 - Acetone - 4 - methyldihydroberberine -HI (Freund) 2874.

α-Acetonylcinnamic anhydride, dimol. (Borsche) 2245.

Acetophenone, 2-pyridylhydrazone (Fargher) 2890; 2-quinolylhydrazone (Fargher) 2890.

Acetophenone - *p* - bromophenylhydrazone peroxide (Busch) 806.

Acetophenone nitrate (Reddelien) 1911.

Acetophenonylidenecyanoacetic acid, Et ester (Scheiber) 1183.

Acetophenylchloronitroamine (Bamberger) 1783.

***o*-Acetophenylnitroamine** and derivs. (Bamberger) 1781–2.

"**Acetopropiodinitrile**" (Mohr) 59.

Acetotriketohexamethylene (Heller) 2541.

***o*-Acetoxybenzaldehyde** (v. Auwers) 1459.

Acetoxybenzene absorption spectra (Valyashko) 2071.

***o*-Acetoxybenzoic acid salts** (Gerngross) 56, P 1225; alk.-earths, Mg and Bi salts (Gerngross) P 356; halogen alkyl esters of (Wolffenstein) P 514; Na salt (Wülfing) P 514;

Digitized by Google

manuf. 691; Ca salt (van Italiie) 800; quinine salt (Vanino) 951; Li salt (Busch) P 1095; (Smith) 1530; "salicol" (Mannich) 1660; Ca and Li salts (J. A.) 1668; derivs. (Jacobs) 2075; bromoethyl ester (Jacobs) 2077; Me ester (Gibbs) 2527; Mg salt (Richter Gedeon, etc.) P 2796; see also *Aspirin*.

o-Acetoxybenzoyl chloride (Wilffenstein) P 1096.

***N* - Acetoxycarbostyrilcarboxylic acid** (Heller) 311.

β - Acetoxy - α - chloroacetylnaphthobenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.

1 - Acetoxy - 2,4 - diacetoxy - 3 - naphthoic acid, Et ester (Nowak) 599.

Acetoxy - 3,5 - dibromobenzyl chloride, 2- and 4-, compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

Acetoxydibromophenylacetoketodihydrobenzmetoxazine and OH compd. (Ekely) 1065.

2 - Acetoxy - 3,5 - dimethylbenzyl chloride and compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

2 - Acetoxy - 3,5 - dimethyl - 4,6 - dibromobenzyl chloride compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

Acetoxyethyl bromide deriv. (Jacobs) 2077.

β - Acetoxy - α - iodoacetylnaphthobenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.

α-Acetoxyisobutyric thioamide (Albert) 1775.

o-Aceto-*sym*-*m*-xylenol (v. Auwers) 1057.

o - Aceto - *sym*-*m*-xylenyl methyl ether (v. Auwers) 1057.

o-Acetoxymesityl pseudochloride (Jacobs) 1611.

Acetoxymethoxybenzaldiacetate (Rupp) 2233.

1 - Acetoxynaphthyldi - α,α - naphthylmethane (Breissecker) 598.

1 - Acetoxynaphthyl - 2 - diphenylmethane (Preissecker) 598.

2 - Acetoxy - 5 - nitrochloroacetylbenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.

Acetylacetone, condensation of Et cyanoacetate and (Simonsen) 2517.

Acetylacetonethiourea (Hale) 1065.

p - Acetylaminobenzoic acids (Ellinger) 328; influence of AcOH, $AcCO_2H$ and $AcCH_2CO_2H$ on formation of, in organism (Hensel) 1640.

Acetylaminocamphonanic anhydride (Noyes) 1062.

Acetylaminohydroxyketo - *peri* - naphthindene (Errera) 446.

Acetylaminonaphthol and NO deriv. (Kehrmann) 625; (Gries. Elek.) P 3133.

Acetylation in animal organism (Ellinger) 328 (Hensel) 1640.

p-Acetylbenzeneazo-p-cresol and derivs. (Hewitt) 204.

p-Acetylbenzeneazo-α-naphthol and acetate, etc. (Hewitt) 204.

β-Acetylbenzeneazophenol and derivs. (Hewitt) 204.

Acetylbenzophenazoxine (Kehrmann) 626.

Acetylbenzoyl derivatives, ring opening and closing (v. Auwers) 806.

Acetyl-p-bromo-m-cresotinic acid (von Walther) 2643.

α - Acetyl - 3 - carboxy - 5 - carbethoxy - β - 4,6-trimethylcoumarinic acid (Jordan) 1604.

Acetylcellulose. See *Cellulose acetate*.

Acetyl chloride, estn. of Al by (Minnig) 771.

β - Acetyl - α - chloroacetyl - α - phenylhydrazine deriv. (Jacobs) 2078.

Acetyl-p-chloro-m-cresotinic acid (von Walther) 2643.

3-Acetyl-4-cinnamalhydantoin (Johnson) 2655.

Acetyl-p-cresotinic acid, bromoethyl ester (Jacobs) 2077.

γ - Acetyl - γ - cyano - β,β - dimethylpropane-α,α - dicarboxylic acid, Et ester (Scheiber) 1182.

Acetyldiacetonamine (Gabriel) 2876.

α - Acetyl - 3,5 - dicarbethoxy - β-4,6-trimethylcoumarinic acid (Jordan) 1604.

Acetyl - 1,1 - dichloro - 2 - hydroxy - 2-cyanoethylene (Kötz) 208.

Acetyldihydrodesoxycinchonine and derivs. (Freund) 458.

α - Acetyl - β,β - dimethylpropanetricarboxylic acid, Et ester and derivs. (Scheiber) 1181–2.

5 - Acetyl - 2,4 - dimethylpyrrole - 3 - carboxylic acid, Et ester (Fischer) 462.

Acetyldiphenylthiosemicarbazides and anhydride (McKee) 3223.

Acetylene, dissolved, *vs.* electricity for lighting (Schneider) 143; filter for (Corn) P 243; -CuCl reaction for water (Weaver) 279; absorbent packing-material for (Wilkinson) P 371, 2146; electrolytic dissociation of, and its metallic derivs. (Skossarewsky) 543; fusibility curve for system C_2H_2-Me_2O (Baume) 547; action of, on Cu compds.—cuproacetylene compds. (Llorens) 767; HOAc from (Hansen) P 1095; halogen hydride addition products of (Griesheim-Elek.) P 1096; as explosive 1115; stepwise reduction of (Paal) 1184, 2650; propylene from methane and (Heinemann) P 1369; action on metals (Reckleben) 1384; storing (Dalen) P 1840 (Picard) P 2585; Leitfaden für Acetylenschweisser (Kautny, book) 1894; electrolytic dissoc. (Skossdrewsky) 2342; syntheses with aid of (Chichibabin) 2512; adsorption by colloidal Pt, Ir and Os and by Pt black (Paal) 2615; "gasol," competitor of (Springer) 2976; L'acetilene e le sue pratische applicazioni (Castellani, Romanelli, book) 2977; analyzing gas mixts. contg. (Gautier) 3123; v. ps. of liquid (Burrell) 3152; see also *Gas, illuminating and fuel; Lighting, gas*.

Acetylene compounds, refraction and magnetic

Digitized by Google

rotation of (Moureu) 1146; (Lespieau) 1310; action of conc. H_2SO_4 on (Zal'kind) 1897; addition of H to (Zal'kind) 2510; C_2H_2 hydrogen halide addition products (Griesheim-Elek.) P 2567; 1-halogenated derivs. (Grignard) 3221.

Acetylene condensations, pyrogenic (Meyer) 306.

Acetylene dichlorides (Chavanne) 2898.

Acetylene generators (Rebenstorff) 1137; *Patents:* (Klenck) (Hamilton) (Ferrel) (Jenkins) (Kohner) 3; (Abbott) (Freeto) 4; (Holloway) (Marot) 5; (Phelps) 258, 259; (Magnus) 259; (Copenhagen) (Hopkins) (Hydroxygen, etc.) 540; feeding carbide to (Dutcher) 733 (Wacjer) 1139; (Fox) 982; (Adsit) (Feer) 1137; (Clefton) 1262; carbide charging receptacles for (Metallwerke Schmitt) 1263 (Hansen) 1559; (Ellis) 1410; (Rosenbluth) 1707; (Freeto) 1862; (Schramm) 1863; (McNoon) 2168; (Braden) 2472; (Duncan) (Banwarth) 2612; (Way) (Jacobs) 2726; (Reece) 2999; (Karl) 3146; (Rodebaugh) (Loehr) (Harris) 3147.

Acetylenic nitriles. See *Nitriles.*

β-Acetylethyldiethylamine (Merling) P 694.

Acetylglycollylsalicylic acid (Hiemens) P 354.

Acetylhydro-α-lapaconc (Monti) 3220.

Acetylmandelic thioamide (Albert) 1775.

***N*-Acetyl-*N*-methylisopicramic acid** (Meldola) 197.

Acetyl-nitro substitution (Harding) 602.

Acetyl phenylimidobenzoyl oxide and -HCl (Kuhara) 1612.

Acetyl phenylimidobenzoyl sulfide (Kuhara) 1612.

Acetylphenylthiobenzamide (Kuhara) 1612.

Acetylpropionitrile and derivs. (Mohr) 59.

α-Acetylpyrrole semicarbazone (Chelintzev) 88.

Acetylpyruvic acid, condensation product of, and phenylaminopyrazolone (Kropp) P 2796.

Acetylsalicylic acid. See *o-Acetoxybenzoic acid.*

3-Acetylthiolphenanthrene (Field) 3229.

3 - Acetyl - 4,5,7 - trimethylcoumarin - 6,8 - carboxylic acid, Et esters (Jordan) 1604.

Achylia, diastase in feces in, gastrica (Brown) 482; of stomach and pancreas (Orlov) 933.

Acid, unsatd., $C_{18}H_{32}O_4$ (Le Sueur) 603; tricarboxylic, $C_8H_8O_6$ (Beesley) 610; $C_{10}H_{14}O_4$, $C_9H_{12}O_3$ and derivs. (Sernagiotto) 797; $C_3H_8O_4$ and derivs. (Baeyer) 1034; $C_3H_{10}O_3$ (Baeyer) 1034; $C_{20}H_{20}O_{12}$ and K salt (Leuchs) 1060; $C_{21}H_{36}O_6$, $C_{21}H_{34}O_5$ (Pyman) 1311; $C_{12}H_{21}O$ and isomer and derivs. (Egorov) 1898; $C_{26}H_{31}O_4N$ (Freytag) 1915; nitrile of bicyclic diimino (Shlezinger) 2069; phenolic, $C_9H_{10}O_4$ (Heyl) 2249; $C_8H_{12}O_6$, and Ag salt (Küster) 2883; $C_{10}H_{11}O_2N$, $C_9H_{11}O_2N$, $C_{11}H_{13}O_2N$, $C_{11}H_{13}O_2N$ (Sen-Gupta) 2892; $C_{26}H_{36}O_2$ and derivs. (v. Auwers) 3238; see also *Acids.*

Acid albuminates. See *Albumin.*

Acid amides. See *Amides.*

Acid anhydrides, action of hydrazobenzene on org. (Simonyi) 88; org. (Müller) P 2292; (Gen. Chem. Co.) P 2568; of α-amino acids (Graziani) 3065.

Acid esters. See *Esters.*

Acidimetry. See *Acids, analysis* and *Acidity.*

Acidity and formation of marcasite and wurtzite (Allen) (Merwin) 187; of Iowa soils (Brown) 347; of soils (Daikuhara) 500 (Voelcker) 2281; of soil in Assam (Meggitt) 500; of wine (Dubrisay) 504 (Paul) 1220; deacidification of wine (Baragiola) 504 (Kulisch) 840 (Astis) 1966; of flour (Thomson) 667; and soundness of corn (Besley) 828; rate of reduction of, of descending waters by ore and gang minerals (Nishihara) 1021; influence on ester content of beers (Windisch) 1089; of tomato fruits (Duggar) 1345; of fats (Renkwitz) 1351; of corn (Besley) 1354; of H_2O_2 soln. (White) (Callan) 1665 (Ramsay) 2970; of *Sphagnum* (Skene) 1797; of vanilla ext. (Winton) 1946; of muscle (Porcelli-Titone) 2103; cause of, of milk—detn. (Van Slyke) 2406; detg. (Traube) 2492, 2911; gastric hyperacidity (Rolph) 2776 (Mintz) 3098; effect of grinding soil on its reaction as detd. by Veitch method (Brown) 2787; of infant stomach (Hess) 2936; curves in stomach and duodenum (McClendon) 2937; of urine (Clarens) 3078 (Zeman) 3279; detn. of, of soil (Fraps) 3316; see also *Acids; Acids, analysis; Hydrogen ion.*

Acidosis, alkalinity of blood and (Sellards) 637; and protein storage (Steenbock) 647; chloride retention, edema and (Fischer) 821, 3095; and starvation and obesity (Folin) 1938; combating, of diabetes (Eustis) 3094; influence of feeding on, in phlorhizinized dog (Benedict) 3278; treatment of (Dunn) 3290.

Acid-proof products (Schlossberg) P 1235.

Acids avidity in non-aq. solns. (Rimbach) 7; delay of ripening of photographic emulsions by (Lüppo-Cramer) 31; action of hydrazobenzene on org. (Simonyi) 88; effects on mortar 139; production by *B. coli* group (Browne) 217; cond. of dil. (Paine) 262; action on $Na_2S_2O_3$ (Vanino) 275; antagonism between, and salts (Osterhout) 327; and permeability (Osterhout) 327; and water relation and metabolism of plants (Dachnowski) 331; and irritability of nerves (Elias) 336; constitution of inorg. (Schaefer) 416; carboxylic, from cyclobutane, etc. (Goldsworthy) 460; solubility of casein in dil. (Van Slyke) 463; action on proteins (Herzig) 467; swelling capacity of muscle in (Arnold) 469; paralysis of peripheral nerves by (Hacker) 484; ionization of, and their activity as catalysts (Dawson) 543; reactions of ions and mols. of (Schroder) 544 (Robertson) 2018 (Marshall) 3155; iso- and heteropoly—monobasic heteropoly (Rosenheim) 570; esterification of polybasic (Wegscheider)

Digitized by Google

600; esterification of dibasic (Wegscheider) 600 (Kailan) 2342; of beet root molasses (Moreschi) 616; from maple sap (von Lippmann) 625; effects on teeth (Lothrop) 632; gastric juice of const. acid conc. (Rehfuss) 650; sol. volatile, and total sol., in butter (Vuaflart) 671; distn. of (Hof) P 698; cond. of, in alc. (Goldschmidt) 745; soln. velocity of metals in (Centnerswer) 745; action on Na tungstate (Lottermoser) 748; org., and yeast (Zikes) 842 (Buromskii) 2772; viscous, light-sensitive soln. of (Sandqvist) 877; addition compds. with org. (Kendall) 908; action on alc. fermentation (Rosenblatt) 923; temp. in acid catalysis (Taylor) 988; leaching of Zn-lime ore with (Ralston) 1023; transformation of terpenes by (Francesconi) 1043; production by *B. delbrücki* in sugar beet mash (Heinzelmann) 1090; carboxylic, of phenols and naphthols (Hauser) 1180; Contribution à l'étude des dihydroresorcines, synthèsis d'acides polybasiques (Vignon, book) 1184; distn. and concn. of (Hof) P 1231; conducting acid vapors (Deut. Ton- etc.) P 1263; action of NH_3 and urea on esters of unsatd. (Philippi) 1302; acidic energy of wines (Mensio) 1526; -spray catcher (Tschudy) P 1543; siphon (Szigeti) 1557; hydrolysis of salts of aromatic carboxylic (Schall) 1583; cuprous salts of O (Daniels) 1586; acid salts of dibasic (Jungfleisch) 1601; hydrazides and azides of org. (Curtius) 1605, 2765; hydrazihydrazides and hydraziazides of tribasic (Curtius) 1607; acyl derivs. of substituted imido (Kuhara) 1612; influence of smoke on soil (Gerlach) 1650; minimum contents of non-volatile, in wines (Baragiola) 1656; (Fabriques de produits, etc.) P 1669; sepg. nitroglycerin from (Weyel) P 1692 (Dynamit-A.-G., etc.) P 2453; action of Mg on halo-aromatic (Zal'kind) 1748; action on bird plasma (Jouan) 1803; influence on respiratory metabolism (Raeder) 1807; and alk. reaction of soils (Masoni) 1816; cellar treatment and. retrogression in wine (Schätzlein) 1825; isomerization of higher, of series $C_nH_{2n-2}O_2$ (Egorov) 1897; influence on activity of malt amylase (Sherman) 1921; excretion in nephritis (Henderson) 1937; and parathyroid tetany (Wilson) 1937; in soils (Stutzer) 1961; effect on rubber (Martin) 2004; hydration and association in C_6H_6 (Szyszkowski) 2015; affinity consts. and catalytic activity (Taylor) 2018; effect on reaction velocity of Ph_3CH dyes (Biddle) 2092; of humus (Fischer) 2119; retrogression in wine (Omeis) 2123; for shop use (Fish) 2130; review of mineral, ind. in 1914; (Reusch) 2130; viscosity and fluidity of aliphatic (Dunstan) 2173; secretion of *Cicer arietinum* (Sahasrabuddhe) 2261; removal from H_2O (Schilling) 2277; formation in malt and barley (Lüers) 2283; $Fe^{\prime\prime\prime}$ salts of uni- and polyvalent non-substituted org. (Weinland) 2360; action on metals (Hale) 2371; and activity of dialyzed malt-tase (Kopaczewski) 2389; unsatd., of anthraquinone series (Bayer & Co.) P 2425; nucleus-chlorinated aromatic carboxylic (Farb.) P 2425; f. p. diagrams of $HCONH_2$ with aliphatic (English) 2476; 2nd dissociation consts. of dibasic (Datta) 2476; theory of (Lapworth) 2477; combinations of, with dimethylpyrone (Plotnikov) 2512; catalyses with weak (Biddle) 2617–8; catalysis of H_2O_2 decompn. by (Lemoine) 2628; transferring, without waste 2697; mechanism of, dye bath (Fort) 2710; denitrating waste (Jahn) P 2710; distribution coeff. and extn. velocity of org. (Pinnow) 2732; heteropoly, contg. vanadic acid and V (Prandtl) 2744; sapon. of esters of dicarboxylic (Wegscheider) 2881; decomp. of acylphenols by EtOH in presence of (Jones) 2891; affinity and biol. activity of (Kopaczewski) 2902; injurious effect of exclusive oat diet, leading to acid poisoning (Morgen) 2929; Eine hochviskose, lichtempfindliche Wasserlösung zweier starken Säuren (Sandquist, book) 2836; reactions between dil. acid solvents and soil phosphates (Prescott) 2961; ferric salts and org. acids induced by light (Scoville) 2967; iso- and heteropoly—unsatd. molybdic acid arsenates and phosphates (Rosenheim) 3039; production of, by contracting muscle (Harvey) 3079; sepn. of mixt. of liquids contg. nitroglycerin and (Weyel) P 3130; influence of neutral salts on tendering of cotton with (Fort) 3131; org., in tendering of cotton by steaming (Pilkington) 3131; action of mineral, on cotton (Cohen) 3132; alloys resistant to (Parr) 3204; carboxylic, of dialkylcyclohexadienes (v. Auwers) 3236; unsatd. hydroaromatic (v. Auwers) 3237; neutralization of acid stomach and intestinal contents (Zaitzev) 3285; concg. (Pfannenschmidt) P 3337; recovering, from cellulose gases (Nebrich) P 3360; pptn. of trinitrotoluene from concd. (McHutchinson) 3361; consts. for double polarization method using (Pellet) 3374; see also *Acidity; Amino acids; Bile acids; Fatty acids; Hydroxy acids; Imido acid.*

Acids, analysis. Corrosion of Fe in detg. strengths of (Friend) 542; detg. very weak (Horiba) 1265; estn. in liquids of animal or vegetable origin (Stutzer) 1794; in malt and barley (Lüers) 2283; detg. in liquor ferri sesquichlorati (Romijn) 2285; acid K phthalate and acid Na phthalate as standards in acidimetry (Hendrixson) 2853; see also *Acidity.*

Acid sulfates. See *Sulfates* and the individual sulfates.

Acid value of chicken fat (Pennington) 220.

Acidyl. See *Acyl derivatives, etc.*

Acidylarylsulfonimides (Bückel) P 2427. 2428.

Aconite, potency (Robinson) 2421.

Aconitine, oxidation of (Barger) 1312.

Acorus calamus, oils from (Russell) 2966.

glycocyamidine towards,—reaction of creatine with dil. (Ellinger) 467; action of HCl on excretion of (Secchi) 477; disintegration of rice grains by (Warth) 489; action of fused, on org. compds. (Le Sueur) 603; gelatinization of pectin in solns. of (Haynes) 632; crops on alkali land (Hansen) 683; action on cellulose (Haupt) 712 (Thies) 713; effect on permeability of protoplasm (Osterhout) 810; electrolysis of fused caustic (Ashcroft) P 1155; decomp. of dextrose in presence of (Fernbach) 1175; insecticidal alkali-S compd. (Hite) P 1220; rate of penetration of marine tissues by (Harvey) 1350; solubilising, in natural double silicates (Leeden) P 1376; discoloration of Na salicylate soln. by (Greenish) 1530; reburning of lime from, waste (Meade) 1670; coloring of picrylmethylamine derivs. by (Franchimont) 1768; influence on respiratory metabolism (Raeder) 1807; relation of distribution of nitrates to (Headden) 1815; thickening lyes (Achenbach) P 1880; isomerization of acids $C_nH_{2n}-_2O_2$ under influence of (Egorov) 1897; action on perfused heart (Burridge) 1934; retention in nephritis (Palmer) 1937; effect of alkali water on dairy cows (Larsen) 1940; in soils (Stutzer) 1961; effect on rubber (Martin) 2004; solns. and org. liquids (Twomey) 2022; for shop use (Fish) 2130; effects on concrete drain tile (Sims) 2137; action on metals (Hale) 2371; manuf. of alkali hydroxides (Reich) P 2441; durability of cement tile in, soil (Wig) 2444; from leucite (Dougherty) P 2573; production of (Jungner) P 2581; highly reactive alk. reagent for dyeing (Badische) P 2596; resistance of lacquer to (Bottler) 2600; catalysis of H_2O_2 decompn. by (Lemoine) 2628; behavior of kaolin toward caustic (Rohland) 2701; recovering, from stack-gases of cement kilns (Newberry) P 2703; interaction of, and alkali bromoacetates (Senter) 2764; from feldspar, leucite, etc. (Rody) P 2798, 2799; action on hexaethoxysilicoethane, etc. (Martin) 2888; decomp. of acylphenols by EtOH in presence of (Jones) 2891; diff. sensitiveness of pepsin and of chymosin towards (Hammarsten) 2904; thermal analysis of mixts. of, with corresponding halides (Scarpa) 2828; saponification of esters by (Wegscheider) 3007; reaction with metol and hydroquinone (Frary) 3036; estn. of hardness of natural waters with reference to (Mayer) 3108; as protective coatings (Rohland) 3134; in clinical conditions (Dunn) 3290; Brit., works 3332; see also *Electrolysis, industrial.*

Alkalies, analysis (Vinson) 1649; in liquids of animal or vegetable origin (Stutzer) 1794; As_2O_3 as standard (Menzies) 2628; acid K phthalate and acid Na phthalate as standards in alkalimetry (Hendrixson) 2853; in soils (Hare) 3316.

Alkali metal alkyl sulfates and alkali nitrites (Neogi), 205.

Alkali metal bromates, detn. of ferrocyanides with (Koninck) 768.

Alkali metal carbonates, formation from neutral salts in light (Neuberg) 58; dissociation of (Alk.)HCO_3 (Caven) 986; production of (Jungner) P 2581; formation (Melikov) 3039.

Alkali metal chlorides and solvent power of water (Philip) 1572; manuf. (Melasseschlempe) P 2160; see also *Chlorides; Electrolysis, industrial.*

Alkali metal compounds, optical rotation (Rakuzin) 3050.

Alkali metal cyanides (White) P 359; regenerating (Fuentes) P 439; (Bucher) P 2972; see also *Cyanides.*

Alkali metal halides, sp. heats (Brönsted) 405; manuf. (Leeden) P 956; sp. surface energy of molten (Jaeger) 2024; b. pa. of (Borgström) 2361; thermal analysis of mixts. of alkali hydroxides with corresponding (Scarpa) 2828; decompn. voltages of molten (Neumann) 3032; see also *Halides.*

Alkali metal hydrosulfites. See *Hydrosulfites.*

Alkali metal hydroxides. See *Alkalies.*

Alkali metal iodides, H_2O_2 2128; action of Br on (Rae) 3182.

Alkali metal nitrates, binary and ternary systems of (Harkins) 2477.

Alkali metal nitrites, alkali alkyl sulfates and (Neogi) 205.

Alkali metal oxides, production of (Jungner) P 2581.

Alkali metal polysulfides (Ruie) 1017.

Alkali metals, manuf. (Acker) P 27 (Kendall) P 590 (Hackspill) P 594 (Nitrogen Prod. Co.) P 783 (MacNitt) P 1280 (Nitrogen Co.) P 2489; spectra of (Theissen) 549 (Nelthorpe) 1003 (Watts) 2481; effect on soln. tension of dissolving, in Hg (Smith) 744; search for element of higher at. wt. than Cs (Baxter) 985; metal additions in liquid NH_3 (Schlubach) 1015; alloys of, with heavy metals (Ashcroft) P 1280; sepn. from alk. earth metals (Gilmour) 1725; prepg. amalgams of (Müller) 2487; sepn. from Mn (Fisher) 2199; elec. furnace for obtaining (Deutsche Gold, etc.) P 2742.

Alkali metal salts, compds. of pyrocatechol and phenol with (Weinland) 319; sp. surface energy of (Jaeger) 2024; electrolyzing (Nelson) P 2625; (Radmann) P 2972; combination of Cl ions in (Hare) 3316.

Alkali metal silicates, sol. (Paterson) P 239; action on clay and kaolin suspensions (Rohland) 852; dissolving (Stanton) P 1672; behavior of kaolin toward (Rohland) 2701; (Spensley) P 2972.

Alkali metal sulfates (Chem. Fab. Rhenania) P 3337.

Alkali metal sulfides, prepn. (Moore) P

Digitized by Google

1231; action on $NaEtS_2O_3$ (Gutmann) 2744; (Sárvárer Kunst.) P 3336.

Alkali metal sulfites, catalysis in oxidation of (Saillard) 1700.

Alkalimetry. See *Alkalies, analysis.*

Alkaline earth chlorides, decompn. voltages of molten (Neumann) 3032.

Alkaline earth compounds, gelatinization of pectin in solns. of (Haynes) 632.

Alkaline earth cyanides (Bucher) P 2972.

Alkaline earth metals, manuf. (Acker) P 27; (Nitrogen Co.) P 2489; effect on soln. tensions of dissolving, in Hg (Smith) 744; sepn. from alkalies (Gilmour) 1725; spectra of (Nelthorpe) 1003; (Hicks) 2482; sepn. from Mn (Fisher) 2199; "chromate method" for sepg. (Vickery) 2853; sepn. of metals of, group (Peterson) 2854; see also *Barium*, etc.

Alkaline earth nitrates, binary and ternary systems of (Harkins) 2477.

Alkaline earth peroxides (Riesenfeldt) 1436.

Alkaline earth salts, compds. of pyrocatechol and phenol with (Weinland) 319; electrolyzing (Nelson) P 2625.

Alkaline earth selenides (Kittlemann) 2185.

Alkaline earth sulfides (Sárvárer Kunst.) P 3336.

Alkalinity, titratable, of blood (Sellards) 637; alkalescence of blood during muscle cramps (Sass) 657; of soils (Masoni) 1816; in *Glomerella* cultures (Reed) 1929; detg. (Traube) 2492; of blood in kala-azar and cholera (Rogers) 2940; in detn. of catalytic coeff. (Giurgea) 3015; of slight skin lesions (Dominicis) 3089; of hydrant water of Munich (Reichard) 3323.

Alkali salts. See *Alkali metal salts.*

Alkali series, rocks of, in Timor (Brouwer) 1448.

Alkaloid betaines (Frerichs) 616.

Alkaloids (Winterstein, Trier, book) 89; of *Papaver somniferum* and life of plant (Mueller) 94; of *Papaver orientale* (Klee) 298 (Gadamer) 300; in nux vomica (Schaefer) 513; of quebracho bark (Ewins) 606; and ketones in light (Paterno) 618; pptn. of serum-albumin and glutin by (Hanzlik) 637; of *Holarrhena congolensis* (Burn) 659; gelsemium (Stevenson) 845; action of fungi on, in opium (Frederichs) 952; of ipecacuanha (Bridel) 953; of lobelia (Chem. Werke v. H. Byk) P 1098; exam of *Calycanthus floridus* for (Miller) 1532; of Brit. Pharm. (Dott) 1664; in tobacco ext. (Noga) 1769; antidotal value of fuller's earth for (Fantus) 1942; of pareira root (Scholtz) 2079; angostura (Troeger) 2079; colloidal state (Traube) 2108; from *Gloriosa superba* (Clewer) 2885; formation in plants (Rasmussen) 2925; in calabar bean (Polonovski) 3221; catalytic action on phys. and chem. processes (Traube) 3252; influence on reductase (Harris) 3253; see also *Belladonna; Quinine; Strychnos alkaloids; Opium alkaloids; Cinchona*, etc.

Alkaloids, analysis (Ferencz) 122; assay of medicinal tablets (Jones) 509; (E'We) 513; H_3BO_3 method (Winkler) 1157; source of error in (Self) 1667; indicator for titrating (H. P.) 2566; (Goubau) 2689; error in assays (Self) 2968.

Alkamine, benzoylated, of the camphor group (Madinaveitia) 3226.

Alkaptonuria (Soderbergh) 2670; (Scheltema) 3279.

Alkoxymethyl ethers, of morphine (Mannich) 1660, P 1975.

Alkylacetoacetic nitriles and phenylhydrazone (Mohr) 59, 61.

Alkylaminoacylpyrocatechols (Bayer & Co.) P 1095.

Alkylaminopurines, new synthesis (Johns) 2078.

4-Alkyl-5-aminopyrasoles (Mohr) 60.

Alkylaminopyridazoneanthronesulfonic acids (Anilin-Fab.) P 383.

Alkylation of alkylated isopicramic acid (Meldola) 196; of phenols (Smyth) 608; of ketones (Kötz) 622; of pyrroles (Oddo) 788; of 2-mercaptopyrimidines (Johnson) 1066; Et orthoformate as alkylating agent (von Walther) 1911.

Alkyl derivatives of cyclohexane series (Kötz) 621.

Alkyl ethers of dihydromorphine (Knoll & Co.) P 955; of indirubin oxime (Farbw.) P 2598.

Alkyl halides, reactions with phenoxides and ethoxides (Schroder) 544; late poisoning with (Graham) 2109.

Alkyl iodides and dimercuriammonium nitrite (Ray) 3231.

Alkylisopicramic acids, alkylation (Meldola) 196.

Alkylmagnesium halides. See *Magnesium compounds.*

Alkyl nitrites and compds. having residual affinity (Harper) 612.

Alkylpyridinium bases, prep. of picrates from (von Walther) 2065.

Alkyl sulfates (Kereszty) P 513.

Alkyl sulfuric acids, formation of thiosulfuric acid and H_2SO_4 from (Neuberg) 472; (Federer) 477.

Alkylthiocarbamides, action of CH_2ClCO_2H on mono- (Rây) 63.

Allantoin, epinephrine and, excretion (Falta) 657; estn. in urine (Plimmer) 812; and allied substances (Dakin) 1906.

Allanturic acid (Titherly) 614.

Allene polymerization (Lebedev) 799.

Allene series, velocity of polymerization in (Lebedev) 799.

Allergy (Meigs) 100.

Allodes - *N* - methyl - 1 - benzyltetrahydro - berberine and -MeI (Freund) 2872.

Allo-α-ethylcinnamic acid and aniline salt (Stoermer) 1758.

Digitized by Google

Allohydrodes - *N* - methyl - 1 - benzyltetra - hydroberberine (Freund) 2872.
Allo-*p*-methoxystilbene (Stoermer) 1757.
Allonitroso compounds (Oddo) 791.
Allo-*o*-nitrostilbene (Stoermer) 1757.
Allo-*α*-phenoxycinnamic acid and derivs. (Stoermer) 1757.
Allo-*α*-phenylcinnamic acid and derivs. (Stoermer) 1757.
Allotropy of Sn (Brönsted) 12; of Zn (Benedicks) 260; of Pb (Cohen) 403 (Heller) 2339; and metastability of metals (Cohen) 590, 987, 1565, 2169, 2339; application of theory of, to electromotive equil. (Smits) 1140, 3023; theory of (Smits) 1140, 1266, 2338; of Sb—of Zn—of Cd (Cohen) 1267; of K (Cohen) 1565; Smits "new" theory of (Kruyt) 1565; of Bi (Cohen) 1867; of Cd (Cohen) 2019; of metals (Holt) 2730; of Na (Cohen) 2731; Mn steel and theory of (Sauveur) 3200.
Alloys, alloying metals *in vacuo* (Simpson) P 52; sp. heat of (Rolla) 173, 2620; electrocond. of liquid (Bornemann) 409; cooling and constitution of binary (Gulliver) 432, 1597; economy of time and heat in prep. of (Guertler) 778; magnetism of (Eger) 780; manuf. (Morcom) P 906 (Kelly) P 2505 (Strohmenger) P 2761; Leduc effect in (Smith) 1002; electrodeposition of (Kremann) 1152; prep. of, for magnetic research (Freudenreich) 1168; of alkali metals with heavy metals (Ashcroft) P 1280; corrosion of nonferrous (Desch) 1295; of high m. p. (Wolfram Lampen A.-G.) P 1299; formation by electrolysis (Bruni) 1432; coalescence and properties of steel and (Portevin) 1453; anisotropy of coarse-grained, and Brinell test (Portevin) 1596; properties at very high or very low temps. on cast (Elmendorf) 431; soldering and brazing (Jointer) 435; coagulation of Au colloidal solns. by Al foil (Veimarn) 742; welding and soldering (Jointer) 780; jointing (Jointer) 906; transverse Stark effect on, doublets (Wetzel) 1426; pptn. in Au metallurgy (Hamilton) 1451; Ni-plated (Canac) 1583; action on water (Jorissen) 1597; reduction of Fe solns. by (Schumann) 1705; acceleration of oxidation of, by Hg (McClendon) 1866; plating Fe with (W.) 1894; consumption in U. S. 2189; rectifier (Schulze) 2189; action of HNO_3 on (Trillat) 2627; in food inds. (Trillat) 2687; cables (Driver) 2740 (Pannell) 3203; engineering uses (Richards) 2758; melting, chips (Gillett) 3204; paint for wooden fermenters (Heuss) 3325; *Patents:* insulation on, wire (Presser) 27 (Spezialfabrik, etc.) 2354; coating, with Cu or CuO (Carbone) 291; Ni plating (Canac geb. Quentin) 292; coloring and decorating (Schumacher) 701; welding and soldering (Thaulow) 2220; solder for (Richardson) 907; rendering resistant to corrosion (Pucillo) 1027; silvering (Bévenot) 1280; prepg., for plating (L'aluminium français) 1280; coating, with Ni (L'aluminium français) 1376; protective coating on (d'Amico) 1456; decorating (Schönbach) 1540; flux for (Gelly) 594, 1171; insulating oxide coatings on, wire (Küttner) 1600; flux for welding (Thaulow) 1742; welding (Montanges) 1896; electroplating (Hall) 2191, 2488; rust-proof articles from (Lang) 2221; coating with (Fritsche) 2378, 2504; soldering (Bensel) 2505; coating sheet metal with (Fritsch) 2506; safety explosive (Sesti) 2815; tinning (Roy) 2870; plating or decorating glass or ceramic ware with (Moench) 3344.

Aluminium, analysis, estn. of, associated with Fe in acetone (Minnig) 771; sepn. of Zr from (Ferrari) 1019; (Van Pelt) 2361; volumetric (Osipov) (Kovsharova) 2493; (Chercass) 2630; in Al alloys (Weirick) 2630; detg. Al_2O_3 and total Al in steel (Kichline) 2747; detection and colorimetric estn. (Atack) 3186.

Aluminium, metallurgy of, elec. (Blanquier) 557; breaking down silicates contg. K and (Peacock) P 1010; from Al phosphate or phosphate rock (Peacock) P 1010; recovering, from feldspar, leucite, etc. (Peacock) P 1099; in Russia (Pushin) 2351; (Legget, geb. Holman) P 2505; Al skimmings, screenings, dross, slags (Lawrie) P 3215.

Aluminium acetate, compds. for medicinal use (Kalle & Co.) P 127, 514; sol. org. compds. from (Eichelbaum) P, 1225.

Aluminium alloys for cooking utensils (Bayliss) P 51; Al-Cu-Zn-Sb (McAdams) P 288; treating, contg. Fe, Si and Mn to reduce elec. and magnetic loss (Hadfield) P 437; flux for (Gelly) 594, 1171; hard (de l'Or geb. Peyjean) P 595 (Suchier) P 1298; hardness of systems Ag-Al (Petrenko) 777; pressure and elec. cond. of Ag- (Beckman) 779; Al-Mg-Cu-Mn (Wilm) P 1028; with Ni (Canac) 1169; adding Mg and phosphor-Sn to molten Al (Naylor) P 1170; Fe-Ti-Al (Goldschmidt) P 1456; with Cu (Andrew) 1597; Ni-Al and Cu-Ni-Al (Read) 1598; (McAdams) P 2054, 2376; (Henemier) P 2376; malleable (McAdams) P 2220; Al solder (Gross) P 2375; Cu-Ni-Al (Joyce) P 2505; (Mastrolorenzi) P 2761; Al-V (Clark) 3204; bronze (Corse) 3205; exposure tests of (Wilson) 3207.

Aluminium bromide, reaction of $(CH_2Br)_2O$ with benzene in presence of (Rabtzevich-Zubkovskii) 1749; compd. with a hydrocarbon (Chugaev) 2898.

Aluminium carbide, pure CH_4 from com. (Hauser) 800.

Aluminium carbonitride (Peacock) P 1010, 1279, 3175.

Aluminium chloride, action of aldehydes on polycyclic hydrocarbons in presence of (Frankforter) 909; dissociation of $MeSO_2Cl$ and $EtSO_2Cl$ by (Böeseken) 1313; action of, and trioxymethylene on cyclohexane (Nastyukov) 1471; in synthesis of 2-methyl-β-hydrindone (Kizhner) 2066; regenerating, used in treating oil (McAfee) P 2309; (Kügelgen) P 2572; improvement of high b. petroleum oils and manuf. of gasoline by action of (McAfee) 2812; action of trioxymethylene on hydrocarbons in presence of (Frankforter) 2900; action of trioxymethylene on p-xylene in presence of (Huston) 2900.

Aluminium compounds, action of Mg salts on org. (Quartaroli) 31; of pyrocatechol (Weinland) 305; in vegetables (Meyers) 1808; thermochem. of (Rolla) 2337.

Aluminium hydroxide, action on $Mg(OH)_2$ (Quartaroli) 32; adsorptive power of (Rohland) 546; cream in removing albumin from urine (Tracy) 2912.

Aluminium iodides, ammonobasic (Franklin) 1016, 1284; etherates (Domanitzkii) 1899.

Aluminium lithium silicates (Jaeger) 894.

Aluminium nitride, NH_3 and pure Al_2O_3 from (Milde) P 129; (Soc. gén. des nitrures) P 564, 1012; (Gebr. Giulini) P 956, 3341; (Peacock) P 1011; (Serpek) P 1155; pernitrides (Peacock) P 1279; sublimation and distn. of (Fichter) 1877; (Badin) P 2295; (Bunet) P 2352.

Aluminium oxides, Al_2O_3 from AlN (Milde) P 129; system: CaO-SiO_2-Al_2O_3 (Rankin) 702; red Al_2O_3 color lake (Tust) P 723; violet Al_2O_3 color lake (Thomaschewski) P 723; ternary fluophosphates of Al_2O_3 (Slavik) 1160; colloidal Al_2O_3 for purifying waste waters (Rohland) 1210; pure Al_2O_3 (Schwahn) P 1227; base-exchanging products contg. Al_2O_3 (Permutit-A.-G.) P 1235; Al_2O_3 as desiccant (Marden) 1264; heat effect of Al

Digitized by Google

sesquioxides in fusions with Na peroxide (Mixter) 1437; compd. $8CaO.Al_2O_3.2SiO_2$ (Jänecke) 1540; alkali-sol., from alunite (Hershman) P 1671; Kayser-Cowles process for Al_2O_3 (Pietrusky) 1831; cathodic phosphorescence of Al_2O_3 (Rohden) 2482; abrasive (Kalmus) P 2489; Al_2O_3 (Kalmus) P 2573; Al_2O_3 from leucite (Dougherty) P 2573; fusing Al_2O_3 (Gerbel-Strover) P 2742; Al_2O_3 from feldspar, leucite, etc. (Rody) P 2798, 2799; reactions with CoO (Hedvall) 2844 (book) 2852; adsorption of pepsin from aq. soln. by Al_2O_3 (Rakuzin) 3071; detn. in silicates (Selch) 3188; formula of aluminous pyroxenes (Cesaro) 3193; see also *Aluminium, analysis.*

Aluminium phosphate, producing P and Al and Ca carbonitrides from (Peacock) P 1010.

Aluminium salts, sol., from minerals (Coolbaugh) P 696; action on plants (Kratzmann) 1345 (book) 1930; effect on clover seedlings (Ruprecht) 2122; basic, of CH_2O-H_2SO_3 (Bleckwenn) P 2795.

Aluminium silicates, alteration products of, rocks (Lacroix) 284; (Gans) P 344, 1083; (Permutit A.-G.) P 831; transformation of, under influence of salt solns. (Schneiderhöhn) 3192.

Aluminium silicon nitride (Peacock) P 696.

Aluminium sulfate, for water coagulation (Hoover) 495; natural Chilean (Bado) 1289; manuf. (Spence) P 2700.

Aluminothermic process for manufg. ferro-Cr (Goldschmidt) P 1455.

Alums, resolution of alums into their components (Haas) 416; mol. structure of (Terada) 876; increasing efficiency of (filter) (Jacobson) 1520; loading in raw stock (Laemmle) 2325; partial substitution of $NaHSO_4$ for, in sizing paper 3129; see also *Chromium potassium sulfate,* etc.

Alundum, thimble in extn. of tanning materials (Seltzer) 251 (Small) 2325.

Alunite, geology of,—pyrophyllite rocks of Kyuquot Sound, Vancouver Is. (Clapp) 1022; potash from (MacDowell) P 1535; alkali-sol. Al_2O_3 from (Hershman) P 1671; in Triassic and Jurassic volcanics (Clapp) 2046.

Amalgamation of ore pulp (Luckenbach) P 590; recovering Au by (Monroe) P 590; tests (Sharwood) 2500; Stamp-Milling and (McFarren, book) 3213; see also *Gold, metallurgy of.*

Amalgamator; *Patents:* ore (Hedges) 51 (Robinson) 288 (Dovel) 438 (Arnold) (Macdonald) 781 (Farmer) 1170 (Wood) 1171 (Patten) (Arnold) 1600 (Haskell) 2504 (Hoffman) 2638; for Au-bearing sands (Carson) 1026 (Hoogendorn) 1027; (Stevens) 1600; (Dibert) 2376.

Amalgams, vol. changes in (Würschmidt) 10; for regenerating H from water (Uyeno) P 357; Na (Vanstone) 409 (Zappi) 3039; reduction of $Fe_2(SO_4)_3$ by Cd (Cappe) 770; Hg-Tl (Pavlovich) 1598; Ca (Cambi) 1880; efficiency in recovery of Au (Thomson) 2052; e. m. f. of Ca (Cambi) 2182; prepg. alkali (Müller) 2487; of Mg (Cambi) 2847, 3024; v. p. of Tl-Hg (Hildebrand) 3152; dental (Atkinson) (McBain) 3300.

Amanitas, action on frog heart (Ford) 105, 218.

Amaurosis, quinine (Terrien) 107.

Amazon stone at North White Plains, N. Y. (Burr) 2859.

Amblyopia, aspirin (Jacobs) 107.

Amblystoma, temp. and rate of heart beat in, embryos (Laurens) 664.

Amboceptors, conc. of bacteriolytic, in normal serum (Malsui) 223; immune bodies in antipneumococcus serum (Avery) 931; tumor immunity (Morgenroth) 934; conc. of protective bodies in antipneumococcus serum (Gay) 1197; influence of shaking, ultraviolet rays, and Röntgen rays (Scaffidi) 1805; in anti-rinderpest serum (Hartley) 2266; producing hemolytic, against sheep corpuscles (Coca) 3092.

Amebicide, emetine-HCl (Stewart) 2969.

Amethyst, circular dichroism of (Perucca) 1159.

Amides, acid, as source of NH_3 in soils (Jodidi) 115; prep. of sec. acid (Brunner) 210; effect of steric hindrance on formation (Morrell) 293; (Franchimont) 294; action of ammono acids on metallic (Franklin) 1016; action of acid, on amides, imides and nitrides of heavy metals (Franklin) 3037; action of NaClO on acid, of α-hydroxy acids (Weerman) 3233.

Amine, $C_{18}H_3(NO_2)_2N{:}CHCH{:}CHCH{:}CHNH_2$ and derivs. (Zincke) 1462; $[C_{18}H_3(NO_2)_2N{:}CHCH{:}CHCH{:}CH]_2NH$ and derivs. (Zincke) 1462.

Amines, condensation products with aldehydes (E. Shering) 127; action of primary, on 1,3-diketones (Rügheimer) 305; addition to metal salts (Peters) 569; and Me_2SO_4 (Werner) 607; physiol. action of proteinogenic (Vanysek) 662; action of HNO_2 on (Oddo) 791 (Neogi) 2229; from phenylnaphthophenazonium (Kehrmann) 802; color and constitution of, from phenylisonaphthophenazonium (Kehrmann) 1051; action of NH_3 on hydrochlorides of primary (Bidet) 1310; formation of azo compds. from (Charrier) 1316; bromination of aromatic (Fuchs) 1463; Hg derivs. of aromatic (Jacobs) 1609; condensation of vanillin and piperonal with aromatic (Wheeler) 1772; mercurial compds. of aliphatic (Raffo) 1881; mol. combinations of (Kochubei) 1898; monohaloacyl aromatic, and salts (Jacobs) 2072; simple monohalogenated, and their hexamethylenetetrammonium salts (Jacobs) 2074; aromatic (Girsewald) P 2130 (Farbw.) P 2427 (Badische) P 2568, 2569, 3118; interaction

Digitized by Google

with dehydrobenzoylacetic acid (Shettle) 2508; extg. aromatic (Chem. Fab. v. Weiler-ter-Meer) P 2568; Ca compds. of aromatic (Ebler) P 2569; of quinia alkaloids (Zimmer & Co.) P 2569; formation of chlorinated, by reduction of nitro compds. (Hurst) 2887; mercuration of aromatic (Morgan) 2889; surface energy of homologous (Jaeger) 3010; condensation of Et acetonedicarboxylate with (Petrenko-Kritchenko) 3052; oxidation of (Suto) 3059; of α-amino acids (Graziani) 3065; physiol. action of, produced by intestinal putrefaction (Eustis) 3099; coupling of diazonium salts with (Karrer) 3239.

Aminoacetic acid. See *Glycocoll*.

Aminoacetylacetone, disemicarbazone (Scheiber) 916.

Amino acid, $C_{17}H_{15}O_4N_3$ **and derivs.** (Leuchs) 2381.

Amino acids, as source of NH_3 in soils (Jodidi) 115; influence of acids and alkalies on optical rotation of (Wood) 196; action on pancreatic juice (Zunz) 212; detection of mono- (Engeland) 469; pptn. of, with $(AcO)_2Hg$ and Na_2CO_3 (Neuberg) 470; in syphilis (Ellis) 655; action on urease (Jacoby) 919; meat ingestion and, of blood and muscle (Wishart) 1630; synthesis of cycloglycylglycines by action of glycerol on (Maillard) 1911; change during fasting (Francesio) 1931; combinations with CH_2O (Azzi) 1943; metabolism of, in organism (Lombroso) 2104; enzymes in malt producing (Adler) 2123; titrating mono-substituted NH_2 group of (Clementi) 2394; detn. in feeds (Grindley) 2407; salting out, and sepn. of (Pfeiffer) 2533; neutral salt compds. of (Pfeiffer) 2652; liver and urea formation from (Jansen) 2662; chem. groups of, in hydrolyzed soil (Potter) 2683; in blood (György) 2774; in com. feeding stuffs (Nollau) 2780; attempts to resolve metallic salts of (Barker) 2895; action of Br on (Siegfried) 2905; rate of metabolism of proteins and (Janney) 2927; anhydrides and amines of α- (Graziani) 3065; spectrographic study (Kober) 3252; amino N detn. (Strauss) 3254; detn. of chem. groups characteristic of diff. (Van Slyke) 3263; action of kidney on (Arton) 3273; action of intestine on (Lombroso) 3274; use of colorimeter with formol titrations (Adler) 3322; of yeast (Meisenheimer) 3324; monohaloacetyl derivs. of, and their hexamethylenetetrammonium salts (Jacobs) 2074; of quinoline series (Kaufmann) P 2569.

Amino aldehydes. See *Aldehydes*.

1-Amino-2-alkoxy-4-arylaminoanthraquinonesulfonic acids (Farbw.) P 3368.

Aminoalkyl benzoates (Gabriel) 2876.

Aminoalkylcrotonic nitriles (Mohr) 59.

1-Aminoanthraquinone-2-carboxylic acids (Badische) P 1396.

Aminoanthraquinones, derivs. (Anilin-Fab.) P 1847.

2-Aminoanthraquinonesulfonic acid (Greisheim-Elek.) P 966.

Aminoanthraquinonylurea (Anilin-Fab.) P 2696.

1-Amino-4-arylaminoanthraquinone-2-sulfonic acids (Anilin-Fab.) P 2818.

Aminoarylsulfonic acid, mercurized (Chem. Fab. v. Heyden A.-G.) P 1975.

o-Aminoazo compounds, benzenesulfonyl derivs. of (Morgan) 2894.

Aminoazobenzene compounds, action on skin (Martinotti) 224; isomerism of (Hantzsch) 1177.

Aminoazo compounds (Casale) 795; constitution (Baly) 1312.

p-Aminobenzaldehyde (Ellinger) 328; and $PhNH_2$ (Rossi) 794.

p-Aminobenzeneazodiethylaniline (Jacobs) 2073.

o-Aminobenzenesulfonic acid (Obermiller) P 1830.

Aminobenzoic acids, polymorphism of derivs. of (Senier) 202, 203; p- (Ellinger) 328; action of α-naphthoquinone on o-, m-, and p- (Hauschka) 912; action of o-, m- and p- on quinones (Suchanek) 913; vanillylidene deriv. of m- (Senier) 1907; action of 1,2,4-chlorodinitrobenzene on p- and m- (Linke) 1910; p-chloroacetylaminoethyl ester (Jacobs) 2075; NH_4 salts of o-, m- and p- (McMaster) 2658; polymorphic anisylidene derivs. of (Senier) 3228.

Aminobenzoylamino compounds (Bayer & Co.) P 155.

3-Aminobenzoyl-o-benzoic thioureides (Anilin-Fab.) P 3132.

3-Aminobenzoyl-o-benzoic ureide (Anilin-Fab.) P 2696.

Aminobenzylidenaniline and picrate, etc. (Rossi) 794.

β-Aminocinnamic acid, Et ester (Philippi) 1302.

Amino compounds, action of allyl isothiocyanate on (Rossi) 795; mercurized (Riedel A.-G.) P 1097; formation of γ-amino derivs. in prep. of, of pyridine (Chichibabin) 2896; of cyclohexane series (Kötz) 621; of substituted benzimidazoles (Maron) P 2457; formation of γ- (Chichibabin) 2896.

Aminocrotonic acid, synthesis of hydroxythiophene derivs. from Et ester (Benary) 1784.

2-Amino-3,5-dibromobenzaldehyde (Fuchs) 1463.

7-Aminodihydroxydihydroquinoxaline, -HCl (Waldmann) 1910.

Amino-2,7-dihydroxyphenanthraquinone and tri-Ac deriv. (Mukerjee) 609.

1-Amino-3,3-dimethylhydantoin (Bailey) 2530.

α-Amino-β,β'-dinitropyridine (Chichibabin) 3057.

4-Aminodiphenyl-3-sulfonic acid (Farbw.) P 2569.

Digitized by Google

p-Aminodipropylaniline (Jacobs) 2073.
α-Amino-α-ethylbutyric acid, derivs. of (Freytag) 1915.
α-Amino-α-ethylbutyrophenone, -HCl (Freytag) 1915.
Aminoethylcrotonic nitrile (Mohr) 59.
β-Aminoethyl methyl ketone and *O*-benzoate picrate (Gabriel) 2876.
Aminoethyl o-tolyl ether (Jacobs) 2075.
Amino group, change of nitro group into (Neuberg) 58.
Aminoguanidine and -HBr (Pellizzari) 450.
Amino-H-acids, identifying (Hesse) 2815.
1 - Amino - 4 - hydroxyanthraquinone - 3 - (or -2-)sulfonic acid dye (Thomaschewski) P 723.
3-Amino-4-hydroxybenzarsine, derivs. of (Farbw.) P 1096.
3-Amino-4-hydroxybenzylpiperidine, di-HCl (Jacobs) 1611.
3-Amino-4-hydroxycinnamic acid, -HCl (Johnson) 2529.
7-Aminohydroxydihydroquinoxaline and salts and derivs. (Waldmann) 1909.
Aminohydroxyketo-*peri*-naphthindene and BzH addition product, etc. (Errera) 446.
2-Amino-3-hydroxyphenazine and derivs. (Kehrmann) 626.
3 - Amino - 4 - hydroxyphenylmethylarsinic acid (Bertheim) 1338.
α - Amino - γ - ketohydrindene - β- carboxylic acid, Et ester (Schleiber) 915.
Amino ketones (Bayer & Co.) P 126, 1226.
Aminolactaldehyde dimethylacetal, *d*- and *l*- (Wohl) 1050.
λ-Aminolauric acid and -HCl, etc. (Le Sueur) 603.
Aminomesitylenes, diazotization (Morgan) 608.
2-Amino-4-methoxybenzoylbenzoic acid (Anilin-Fab.) P 2696.
2 - Amino - 5 - methoxyphenyl mercaptan (Fries) 785.
α-Amino-α-methylbutyric acid, derivs. of (Freytag) 1915.
α-Amino-α-methylbutyrophenone and salts (Freytag) 1916.
Aminomethylcrotonic nitrile (Mohr) 59.

2-Amino-4-sulfobenzoylbenzoic acids (Anilin-Fab.) P 2696.

Aminothiazoles, sulfonic acids of (Bayer & Co.) P 1999.

2-Amino-5-thiotolene-4-carboxylic acid, Et ester and chloroplatinate (Benary) 1785.

1,2,4-Aminotolylglycine, -HCl (Pollak) 2063.

2-Aminotolyl methyl 4-sulfide and derivs. (Zincke) 55.

β-Amino-β-uraminobutyric acid, Et ester (Philippi) 1302.

m-Aminoxanthone and -HCl and Ac deriv. (Purgotti) 70.

Ammonia, anodic oxidation of, in alk. media (Scagliarini) 33; sources of, in soils (Jodidi) 115; system: NH_3–H_3PO_4–H_2O (Parker) 168; Plöchl's reaction (Knudsen) 300; conversion into HNO_3 or NH_4NO_3 (Donath) 356; combustion to NO (Wehrheim) 417; d. of liquid (Baume) 547; fusibility curves for systems Me_2O–NH_3 and MeOH–NH_3 (Baume) 547; catalytic oxidation of (Österreichischer, etc.) P 698 (Landis) P 3339; household (Snell) 848; refrigerating machine (Smith Refr. Co.) P 850; explosibility of NH_3-air mixts. (Schlumberger) 862; formation by elec. discharges (Briner) 881; escape from soil treated with liquid manure (Liechti) 947; metal additions in liquid (Schlubach) 1015; action on 2,3,4-trinitrodimethylaniline (van Romburgh) 1175; in rain water (Miller) 1208; action on esters of unsatd. acids (Philippi) 1302; action on primary amine hydrochlorides (Bidet) 1310; action on *l*-α-chloroglutaric acid (Moreschi) 1326; equil. (Tamaru) 1423; (Haber) 2013; for filling air ships (Sander) 2294; in circulating blood (Rohde) 2397; interaction with dehydrobenzoylacetic acid (Shettle) 2508; migration of ions and transport of, in ammoniacal solns. of $CuSO_4$ (Reychler) 2616; heat of formation—sp. heat—U as catalyzer in synthesis of (Haber) 2619–20; formation during carbonization of coal (Simmersbach) 2705; concn. cells built up from ammoniacal solns. of Ag salts (Reychler) 2733; linking of, in protein compds. (Anderson) 2908; reactions in liquid (Franklin) 3037; condensation of Et acetonedicarboxylate with (Petrenko-Kritchenko) 3052; action on phenols (Horowitz) 3085; v. ps. of liquid (Burrell) 3152; transport of, in ammoniacal solns. of $AgNO_3$ (Reychler) 3153; Properties of (Goodenough, book) 3167; synthesis of albumin from 3254; Brit., works 3332; as by-product in sugar factories (Donath) 3375; see also *Ammonia industry.*

Ammonia, analysis, distn. flask (Wempe) 257; by H_3BO_3 method (Winkler) 899 (Bernard) 1078 (Pilz) 1886; in soils (Potter) 945 (Tarassov) 946; detg. protein (Winkler) 1491; precipitant for (Graves) 1587; CH_2O process 1990; tube for rapid distn. (Pozzi-Escot) 2165; in urine (Bonnema) 2549; see also *Kjeldahl method.*

Ammonia compounds, *cis*-sulfonyldiacetatodiethylenediaminecobaltic H sulfonyldiacetate (Price) 566; of halides of Ni and Co (Biltz) 568.

Ammoniacum oil (Schimmel & Co.) 2692.

Ammonia industry, history of direct production process (Ohnesorge) 236; synthetic (Haber) 515 (Bambach) 1372; liquid (Muir) 1372; manuf. of concd. NH_4OH (Hilgenstock) 2130; Lymn NH_3 recovery plant 2143; *Patents:* still (Wright) 3 (Duncan) 129; from AlN (Milde) 129; synthetic (Bosch) 130, 1099, 2573, 2800, 3336 (Kunheim & Co.) 518 (Koepp & Co.) 1376 (Haber) 2699 (Hlavati) 2576, 3121 (Pier) 3334; (Pier) 237; (Bayer & Co.) 358; from $CaCN_2$ (Österr. Ver., etc.) 358 (Lidholm) 1100 (Landis) 2699, 3333; (Badische) 362, 956, 1228, 1230, 1377, 2298; recovery from gas (Mond) 370 (Cobb) 371 (Moore) 1992 (Otto & Co.) 3125; (Summers) 563; (Peacock) 695; from bituminous coal (Maclaurin) 1108; distn. of, water (Becker) 1109; Si C compd. for producing (Peacock) 1010; removing from coal gas (Lloyd) 1242; absorption processes (Ormandy) 1375; (Stauber) 1376, 1673; (MacLaurin) 1387; (Hargreaves) 1673; (Waldeck) (Haakh) (Chem. Fab. Pommerensdorf) 1833 (Wolf) 1834; (DeJahn) 1978, 2295, 2799; (Williams) 1979; -recovery gas producers (Rigby) 1991; destroying obnoxious gases and vapors in distn. of, water (Becker) 2308; distg. liquors (Schuster) 2308; (Pollard) 2433; from beet-molasses waste water (Huber) 2463; absorption app. (Vogt) 2472; condenser (Stutsman) 2472; (Torfentgasung Stauber) (Viganó) 2804; NH_3 from $Ba(CN)_2$ (Thorssell) 3340; recovering ammoniacal vapors from coal gas (Tschudy) 3352; see also *Ammonium sulfate.*

Ammonia-soda process (Clemm) P 130; (Jurisch) 2429; see also *Sodium carbonate.*

Ammonification of soil (Green) 499 (Lipman) 834; of Oregon soils (Beckwith) 500; $CaCO_3$ and $MgCO_3$ and (Kelley) 946; in Hawaiian soils (Kelley) 1084; of cyanamide (Löhnis) 1085; bacteriology of (Given) 2559.

Ammonium acetate, soly. of $PbSO_4$ in (Blomberg) 3184.

Ammonium bases, secretory effect of quaternary (Launoy) 657; pharmacol. action of quaternary (Nurn) 1202; see also *Ammonium compounds; Ammonium salts.*

Ammonium bromide, interaction of atacamite with (Chumanov) 3185.

Ammonium carbonate and detn. of humus (MacIntire) 346; sepn. of Mg from Li by (Dinwiddie) 1885.

Ammonium chloride, by-product of coke-plants, etc. (Strommenger) 143 (Koppers) 515; growth of corn (Caldwell) 685; plant (Barnick) 1226.

Ammonium chlorobromoiodide (Chattaway) 1015.
Ammonium citrovanadate (Barbieri) 3038.
Ammonium compounds, treating soil to oxidize, to nitrates (Wood) P 233; treating org. refuse contg. (Butterfield) P 497; stereochem. and biol. action of (Plate) 1071; from gas liquor (Berlin Anhaltische, etc.) P 2145.
Ammonium cyanate (Evans) P 2705.
Ammonium dichloroiodide (Chattaway) 1015.
Ammonium dioxalodiamminechromiate (Werner) 34.
Ammonium dioxalodiaquochromiate (Werner) 35.
Ammonium dioxalohydroxoaquochromiate (Werner) 36.
Ammonium disalicylatodiamminechromiate (Barbieri) 2849.
Ammonium halides, thermal data, ds. and dissociation of (Smith) 748; NH_4 perhalides (Chattaway) 1015.
Ammonium hexachloroplumbate, derivs. (Gutbier) 1014.
Ammonium hydroxide, impurities (Goerlich) 845; electrochem. oxidation of (Turrentine) 1586; pigments produced from thymol by (Gies) 3085.
Ammonium magnesium sulfate, solubility, freezing curve and cryohydric point (Porlezza) 1571.
Ammonium methyl sulfate, transformation of, and of substituted (Werner) 607.
Ammonium molybdate, recovery of, used in phosphate estns. (Prescott) 3041.
Ammonium molybdenum semipentoxide trihydrate (Mawrow) 2359.
Ammonium nickelomolybdate (Barbieri) 897.
Ammonium nitrate, treating soil to oxidize NH_4 compds. to (Wood) P 233; conversion of NH_3 into (Donath) 356; as fertilizer (Wagner) 502; rounded granular (Gallup) P 1118; manuf. (Wülfing, Dahl & Co.) P 1230; explosive (Grorud) P 3363.
Ammonium persulfate (Kameyama) 1432.
Ammonium phosphates, manuf. (Washburn) P 129, 1978, 2798; NH_4 superphosphates in calcareous soils (Wlodeck) 116.
Ammonium phosphomolybdate, pptn. in presence of H_2SO_4 (Falk) 1725.
Ammonium salts contg. thiocyanate as fertilizers (Stutzer) 686; evapg. solns. of (Holmes) P 697; valence of N in (Noyes) 1062; and tillering of wheat (Wild) 1218; solns. (Slade) 2013; treatment of crude (Bonneau) P 2297; action on HgI_2 (Guareschi) 2358; neutral, of substituted benzoic acids (McMaster) 2658; N sparing action of (Grafe) 3279; see also *Ammonium bases; Ammonium compounds.*
Ammonium sulfate, $NaNO_3$ *vs.*, as fertilizer (Pospisil) 116; in calcareous soils (Wlodeck) 116; from peat (Rossi) 116; temps. in mfg. (Shrewring) 367; action on potato and sugar beet (Mausberg) 685; production in 1914 848, 2811; production statistics (Bradbury) 1217; (Barnick) 1542; improving quality (Milbourne) 1542; economical working of, plants and quality of (Shewring) 1683; discolored 1839; action of NaCl used with, in beet fertilizers (Schneidewind) 2122; filter for waste gases from manuf. (Reinhard) 2143; coloring of (Bianchetti) 2583; *Patents:* manuf. (Collett) 516 (Badische) 517 (Chur) 859 (Bosch) 1227 (Bambach & Co.) 1233 (Easterfield) 1242 (Berlin-Anhaltische, etc.) 1243 (Still) 1543 (Badische) 1834 (Vis) 2799, 2800 (Mackenzie) 2811 (Tschudy) 3351 (Mackenzie) 3352.
Ammonium sulfide, pptn. of Zn and Mn with (Seeligmann) 40, 1884; action on thujone and carone (Agostinelli) 619.
Ammonium tetraoxalodiol dichromate (Werner) 37.
Ammonium uranyl chloride, polarized fluorescence of (Nichols) 3020.
Ammono acids, metallic salts of (Franklin) 1016.
Ammonobasic iodides of Al (Franklin) 1016.
Ammunition. See *Explosives.*
Amorphous phase in hardening of steels (Humfrey) 436.
Amovin 955.
Ampère, Memoirs (book) 886.
Ampere hour meter 1276.
Amphibia, development of, embryos irradiated with Ra (Stachowitz) 1350; adaptability of, to external liquids (Brunacci) 1944, 2268, 3103; intracellular digestion and assimilation in, embryos (Coghill) 3102.
Amphibole, normal-symmetric (Brouwer) 577; speziaite (Colomba) 577.
Amphibolites, chem. nature of feldspar (Loewinson-Lessing) 583.
Ampoules, glass for (Kroeber) 1675; filling (Murat) 2611; (Skinner) (North) 2967; sterilizing and filling (Stick) 3326.
Amygdalic acid (Yamashita) 623.
Amygdalin of seeds of *Prunus domestica* L. (Kassner) 951.
Amyl acetate (Farbw.) P 2425.
Amyl alcohol, fermentation of methylethylpyroracemic acid (Neuberg) 472; detection in alc. solns. (Hofländer) 2041; sepg. EtOH from (Marin) P 2124; recovery in acid-butyrometric detns. (Kreis) 2949.
tert-**Amylamine**-*N*-**phosphine oxide** (Michaelis) 1031.
Amylamine-*N*-**phosphinic acid**, Et ester (Michaelis) 1031.
i-**Amylammonium hexabromo-osmiate** (Gutbier) 1439.
i-**Amylanilinium hexabromo-osmiate** (Gutbier) 1439.
i-**Amylanilinium hexachloro-osmiate** (Gutbier) 1440.
Amylase of potato (Doby) 476; blood s-

Digitized by Google

urinary (King) 633; increase in temp. in action of pancreatic (Serono) 636; pathol. changes of potato (Deby) 1190; and non-protein N retention in U nephritis (Fitz) 1638; malt (Sherman) 1921 (Petit) 3070; action of high frequency current on activity of pancreatic (Punnett) 3072.

Amylene phosphorate (Willstätter) 309; reaction with CCl_3CO_2H (Timotheev) 2896.

Amylenenitrolacetoacetic acid, Me ester (Wallach) 1458.

Amylenenitrolethylacetoacetic acid, Et ester (Wallach) 1458.

Amylenenitrolmethylacetoacetic acid, Et ester (Wallach) 1459.

Amylenenitrolpropylacetoacetic acid, Et ester (Wallach) 1458.

Amyl magnesium chloride, action of tertiary, on Et oxalate (Venus) 1904.

Amyl nitrite (Taylor) 235.

Amyloids in crystallofor cells (Politis) 1347.

Amylolysis. See *Starch.*

Amyl orthovanadate, tertiary (Hess) P 1369.

Amyloses, plurality of (Tanret) 2323.

Amyloxyphosphazoamylamine (Michaelis) 1031.

Amylquinolindigo (Chilikin) 2507.

Analcite basalt (Washington) 483 (Pelikan) 3196; of Crowsnest volcanics (MacKenzie) 1734.

Analgesic, morphine as, in obstetrics and surgery (Bertrand) 1663.

Analysis, modification of Fehling-Soxhlet method (Carletti) 38; chlorohydrocarbons in chem. (Gowing-Scopes) 40; Qual. and Quant. (Gardiner, book) 41; Qual. Analyse auf präparativer Grundlage (Strecker, book) 41; Qual. Chem. (Vorisek, book) 41 (Bivins, book) 1020; symbolical representation of operations (Gowing-Scopes) 183; metallurgical (Massinon) 184 (White, book) 1731; titration table (Potter) 257; analytical chem. 1913 (Musatty) 277; Org. Analysis (Clarke, book) 280; Principles of quant. (Blasdale, book) 280; testing glass app. for volumetric 419; Collegiate Qual. (Martin, book) 424; Qual. Chem., of Inorg. Substances (Noyes, book) 424; sepn. of Fe and Mn groups (Pelt) 768; $TiCl_3$ in qual. (Monnier) 768; electrometric titration of dichromate and Fe (Ziegel) 898; Lab. Guide to Qual. (Bailey, Cady, book) 901; Quant. Chem. Analysis (Allen, book) 901; Manual of Quant. (Frank, Clemans, book) 901; Die Methoden der Massanalyse (Beckurts, Lüning, book) 901; Anleitung zur qual. chem. Analyse (Pechmann, book) 901; Tech. Methods (Lunge, Keane, book) 901 (Lunge, *et al.*, book) 1159, 1444; Qual., and Practical Chem. (Clowes, book) 1020; boric acid method (Winkler) 1157; Lab. Manual of Qual., for Students of Medicine, Dentistry and Pharmacy (Bliss, book) 1159; Nachweis, Bestimmung und Trennung der chemischen Elemente (III) Kupfer, Cadmium, Wismut, Blei (Rüdisüle, book) 1159; Systematic Qual. (Caven, book) 1159; Traité complet d'analyse chimique appliquée aux essais industriels (Post, *et al.*, book) 1159; Uebungsbeispiele zur quant. Analyse (Meigen, book) 1159; chem., review (Jones) 1285; fluorescence in microchem. (Lenz) 1285; of minerals and ores (Schoeller) 1441; teaching (Chapman) 1441; Muter's Manual of Analytical Chem. (Thomas, book) 1445; interferometer for, of solns. (Adams) 1587; permanganate titrations (Ziegel) 1588; analytical chem. of Brit. Pharm. 1914 (Self) 1666; of Cu and Sn groups (Gilmour) 1725; entrainment reactions in (Meillère) 1726; of org. substances (Dubsky) 1730; Quant. ((Moody) (Talbot), book) 1731; volumetric, of liquids at diff. temps. (Pellet) 1883; physico-chem. of monovarient systems of hydrolyzable salts (Shpital'skii) 1864; spectrography in (Lewis) 1883; elementary org. estn. (Tanaka) 1505; proteolytic power of blood in (Zunz) 1505; anaphylactic symptoms produced by trypsin (Ishiwara) 1510; activation of antibody by cell (Weil) 1638; to fly sting (Weber) 1638; reactions produced by albuminous substances of cryst. lens (Morax) 2265; reaction with proteoses of seeds (Wells) 2400; effect on coagulation of blood (Lee) 2667; mechanism of anaphylactic shock (Jobling) 3095; content in expired air of protein detectable by anaphylactic reaction (Lucas) 3072; (Zinsser) 3091; toxicity of guinea pig urine and (Eustis) 3093; action of β-imidazolylethylamine and (Eustis) 3094; response of fallopian tube (Weil) 3292; (Weil) 3293.

Anatomical preparations, mummifying (Deegener) P 2298.

Andesite (Serra) 774.

Andrographolide (Gorter) 442.

Anemia, resisting power of red corpuscles in (Antonelli) 222; enterogenous (Hess) 334; N metabolism in pernicious (Minot) 482; hemolytic (Troisier) 652; retention of Fe in organs in (Muir) 1199; cholesterolemia in (Cantieri) 1804; serum in hemolytic (Bastai) 1935; injections of Fe in (Chistoni) 1939; factors of coagulation in primary pernicious (Drinker) 2266; urobilin in stool in pernicious, as influenced by splenectomy, transfusion and salvarsan (Robertson) 2929; hemolytic activity of spleen in pernicious (Robertson) 3288.

Anemometry, convection consts. of Pt wires and hot-wire (King) 1004.

Anemonin (Asahina) 1482.

Anesthesia, Local (Allen, book) (Braun, book) 108; effect on kidney function (Miller) 1201; from Mg (Cloetta) 1204; exosmosis from roots of anesthetized plants (Merrill) 2103; by phenylethylmalonylcarbamide (Symes) 2402; toxicity of $CHCl_3$ for (Hale) 2421; oil-ether colonic (Baskerville) 2769; spinal, in cat (Smith) 2778; residual valency of anesthetics (Mathews) 2940; irritation of kidneys after novocaine (Morian) 2943; influence on liver (Funke) (Saylor) 2944; dextrose and diastase content of blood as affected by ether (Ross) 3099; in dentistry (Riethmüller) 3299; blood changes produced by N_2O and O (Casto) 3301.

Anesthetics, Modern (Silk, book) 125; liver function and (Whipple) 934; rate of evapn. of ether from oils (Baskerville) 2769; coagulation time of blood—influence of (Mendenhall) 2779; action in preventing increase of cell permeability (McClendon) 2780; residual valency of—importance in anesthesia (Mathews) 2940; local (Rutherford) P 3118.

Angostura alkaloids (Troeger) 2079.

Anhydrides. See *Acid anhydrides.*

Anhydrite, gypsum and (Wallace) 578; in U. S. (Rogers) 2860.

Anhydroacetaldehydophenylglycinamide - *o*-aldoxime and glycine-aldoxime (Gluud) 1615.

Anhydroacetylaminohydroxyketo - *peri* - naphthindene (Brrera) 446.

Anhydrobenzaldehydophenylglycine - *o* - aldoxime (Gluud) 1615.

Anhydro - *o,o'* - biphenylenebis[diphenylcarbinol] (Schlenk) 1918.

Anhydrobis - 1,2 - diketo - 5,6 - dimethoxyhydrindene (Perkin) 201.

Anhydrobisdimethyloxy - γ - methylglucoside monoacetone (Irvine) 1908.

Anhydrobisdimethyltetramic acid and dihydro compd. (Gabriel) 322.

Anhydrocamphorphoronehydroxylamine and salts (Francesconi) 2235.

Anhydrocinnamaldehydophenylglycine - *o* - aldoxime (Gluud) 1615.

Anhydrocymarigenin (Windaus) 2379.

Anhydrodigitalin (Kiliani) 1336.

Anhydroformaldehydophenylglycinamide - *o*-aldoxime and glycine-aldoxime (Gluud) 1615.

Anhydrohydroxylamino compounds (Francesconi) 2234.

α,α₁ - Anhydro - idosaccharic acid and acid K salt (Levene) 2079.

α,α'-Anhydromucic acid (Levene) 3068.

Anhydropropionaldehydophenylglycine - *o* - aldoxime (Gluud) 1615.

Anhydrous substances, prepn. (Atkins) 1569, 2473.

Anilic acids of the succinic acid series (Morrell) 293.

Anilides of the succinic acid series (Morrell) 293.

Anilidoquinones (Hauschka) 912.

Aniline, viscosity in system: allyl mustard oil–(Kurnakov) 11; system HgI_2–$PhNH_2$ (Pearce) 294; compd. of $Hg(OAc)_2$ and, and Ac deriv. (Vecchiotti) 448; from nitrobenzene (Marwedel) P 721; and *p*-NH_2BzH (Rossi) 794; phenol condensation product in solid soln. with (Baekeland) P 1227; bromination of (Franzen) 1911; color of mixts. of, with aromatic nitro compds. (Biorn) 2069 (Orlov) 2069; nitration of haloacyl derivs. (Votocek) 2380; poisoning (Hartsough) 2943; condensation of di-α-naphthylmethane derivs. with (Magidson) 3057; compd. with dimethylchromone (Simonis) 3251.

Aniline black, dyeing (Vergé) P 156, 247, 723 (Steynis) P 3367.

Aniline dyes. See *Dyes.*

Aniline perchlorate, sepn. of K and Na by (Hill) 2363.

Anilinium hexabromo-osmiate (Gutbier) 1439.

1 - [Anilino - *p* - aldehydophenylhydrazonebenzyl] deriv. (Lugner) 1464.

Anilinoimidoacetic acid, Et ester (Schmidt) 83.

Anilinoimidoacid esters (Schmidt) 83.

Digitized by Google

Anilinoimidopropionic acid, Me ester (Schmidt) 83.

Anilinoisoquinolinium pseudocyanide (Zincke) 1463.

1 - [Anilino - *p* - phenylazomethinbenzyl] - 2 - hydroxy - 3 - naphthoic acid, Me ester (Lugner) 1464.

Anilinophenylphosphinic acid, Et ester (Michaelis) 1033.

Anilinotolylphosphinic acid and Et ester, etc. (Michaelis) 1033.

Animal extracts. See *Organ extracts.*

Animal liquids. See *Body fluids.*

Animal organism, metabolism product of, after administering phenylacetic acid (Thierfelder) 86; heliotropism of (Hess) 89 (Loeb) 2391; defensive measures against foreign substances in blood (Heger) 213; comp. in nutritional disturbances (Klose) 219; elimination of CO by (Ledent) 224; acetylation in (Ellinger) 328; distribution of As in (Underhill) 337; α-methyltryptophan in (Ellinger) 462; biochem. significance of P (Kincaid) 635; extg. metals from living (Clague) P 640; degradation of cholesterol in (Lifschutz) 650; luminescence of human body (Haschek) 812; distribution of injected choline in (Euinger) 930; combustion processes in (Höber) 1495; papaverin in (Zahn) 1512; utilization of Ca and H_3PO_4 compds. by (Fingerling) 1800; utilization of plant protein by (Boruttau) 1800; Physiology and Pathology of Water Absorption in (Fischer, book) 1805; biochem. systems in development of (Bechterew) 1923; distribution of gastrin in (Keetom) 1932; effect of cholera toxin on (Cicconardi) 1934; metabolism of amino acids in (Lombroso) 2104; basal metabolism and body surface (Means) 2261; synthesis of hippuric acid in (Raixiss) 2261; effect of functional activity on metabolism, blood-flow and exudation in (Barcroft) 2264; in org. evolution (Pike) 2397; utilization by, of yeast (Völtz) 2661; glycogen in (Vitali) 2663; significance of distribution of urea in (Davis) 2777; distribution of C_4H_8 in (Joachimoglu) 2917; distribution of neuronal, bromural and adalin in (Gensler) 2945; forms of growth resembling living, deposited from solns. of inorg. colloids (Moore) 3069; tyrosine in demonstration of origin of (Bastian) 3075; utilization of CO by (Krogh) 3103; gluconic acid in (Paderi) 3252; action of temp. and humidity on (Lee) 3258; see also *Chicken*, etc.

Animals, potash mother liquors and, life in river water (Vogel) 1208; calorimetry (Wishart) (Csonka) 1630 (Lusk) 1631; mummifying stuffed (Deegener) P 2298.

Anions. See *Ions, electrolytic.*

Anisaldehyde dibenzoate (Wenzel) 599; xylylhydrazones, etc. (Padoa) 1318–9.

Anisaldehydracetic acid (Borsche) 313.

α-Anisallevulinic acid, semicarbazone (Borsche) 2245.

Anisalmethylsemicarbazide (Backer) 2384.

Anisalphenylhydrazone peroxide (Busch) 806.

Anise oil, I absorption of (Morin) 1531.

Anishydrazones and phototropy (Padoa) 1319.

Anisic acid derivs. (Jacobs) 2075, 2077, 2078; inositol esters (Griffin) 2091; pinitol esters (Griffin) 2092; basic mercuric salt (Lajoux) 2527.

Anisidines, polymorphism of derivs. of (Senier) 203; vanillylidene derivs. of *m*- and *p*- (Senier) 1907.

Anisidinium hexabromo-osmiate, *o*- and *p*- (Gutbier) 1440.

Anisil, tolylosazones, etc. (Padoa) 1319–20.

Anisole, absorption spectra of (Purvis) 2184.

***m*-Anisolesulfochloride** (Fries) 785.

Anisotropic substances, electromagnetic field in (Francesco) 1426; chem. reactions in (Tammann) 1864.

Anisotropy of coarse-grained metals and alloys and Brinell test (Portevin) 1596; of liquid-crysts. (Svedberg) 2830.

4 - *o* - Anisylazo - 1 - naphthylamine and derivs. (Casale) 796.

9 - *o* - Anisylazo - 10 - phenanthrol and Et ether (Charrier) 794.

***p* - Anisyldi - α - naphthylmethane** (Magidson) 3057.

Anisylideneanthranilic acid and oxazine (Ekely) 1065.

Anisylidenearylamines, polymorphic (Senier) 3228.

Annealing steel or Fe sheets, etc. (Carnahan) P 50 (Kugel) P 52 (Ridd) P 1296; Heat-treatment of Steel (book) 1026; polished jewelry (Kammerer) P 1296; influence on characteristics of light-sensitive Se (Dieterich) 1427; vessel (Römer) P 1559; steel (Oberhoffer) 1741 (book) 3213; of metals (Hughes) P 1743 (Méker) 2215; furnace (Gibbons Bros.) P 1863 (Ingraham) P 2504 (Brayshaw) P 2760; malleable Fe castings (Fryer) P 2638; microstructural changes in, of bronze (Rawdon) 3205; influence of time of, on softening of stretched bronze wires (Müller) 3208; of brass cartridge cases (Krom) 3210; Si sheet steel (Ruder) P 3215.

Anodes, badly conducting film on Cu, in Cu cyanide solns. (Miller) 558; forming Cu-Ni, for electrolytic sepn. (Hybinette) P 1009; MnO_2 (Siemens & Halske A.-G.) P 1156. 1279 (Isherwood) P 2191; complications at, in Ag coulometer (Richards) 1431; cooling rectifier (Brown, Boveri et Cie.) P 1585; reclaiming Ni, 2034, 2840; soln. of Pb at (Bell) 2351; bar Ni, *vs.* flat (Hall) 2739; anodic potentials of Ag (Reedy) 2838, 3041; anodic behavior of alk. borate and perborate solns. (Polack) 3033; drop in e. m. f. (Reichenheim) 3149; electrolysis of $CuSO_4$ liquors using C (Addicks) 3172; see also *Electrodes.*

Anodonta, blood of (Calugareanu) 3302.

Anthraquinonyl-2-acrylic acid (Bayer & Co.) P 2425.
μ-Anthraquinonylanthraquinoneimidazoles and sulfates, etc. (Schaarschmidt) 784, 785.
μ-β-Anthraquinonylbenzimidazole (Schaarschmidt) 784.
***N*-Anthraquinonylisatins** (Bayer & Co.) P 2598.
2-Anthraquinonyl methyl sulfone (Field) 3229.
Anthrimides and derivs. (Eckert) 601.
Antibodies, heterogenetic (Fukuhara) (Tsunecka) 102; absorption of Wassermann reaction, by organ emulsion (Mundt) 822; mechanism of antibody reaction (Thiele) 1199; production by antigens (Reiter) 1506; activation of, by cell (Weil) 1638; action of oxidizing substances on (Belin) 1938; suprarenal (Sézary) 1938; tuberculosis, and tubercular hypersensitiveness (Ungermann) 2551; persistence of typhoid, in blood of inoculated persons (Dreyer) 2667; sepn. of, in hog cholera serum (Eberson) 3092; effect on antibody production of removal of organs (Hektoen) 3093; X-rays and production of (Hektoen) 3093; cellular processes in latent period (Weil) 3293.
Anticathodes, cooling, of Röntgen tubes (Reiniger) P 1156.
Anticoagulation, immunization against, effect of hirudin (Vera) 654.
Anticryptogams (Tommasi) 1525.
Antidote, As (England) 843; for $HgCl_2$ poisoning (Barbour) 1204 (Hall) 1531; antidotal value of fuller's earth for alkaloids (Fantus) 1942.
Antienzymes, bacterial (Jobling) 482; antiferment action of serum (Halsen) 656; bacterial enzymes that liquefy gelatin and their (Bertiau) 1493; ferment action—serum, after feeding and during tryptic shock (Jobling) 2904.
Antiformin, resistance of bacteria against (Spindler) 3269.
Antigens, specificity of cholesterol-reinforced heart, in Wassermann reaction (Walker) 98; glycoproteins as (Elliott) 100; complement fixation with Besredka's (Bronfenbrenner) 223; animal proteins as (Salus) 823; antibody production by (Reiter) 1506; excretion of (Porter) 1639; suprarenal, in Wassermann reaction (Sézary) 2106; mixed, method of detecting vegetable proteins (Zade) 2267; antigenic action of proteins of typhoid bacillus (Sebastiani) 2551; antigenic properties of sterilized vaccines (Taylor) 2668; reaction of tissues to antigen stimulation (Coca) 3092; detection and concn. (Glenny) 3262; action of blood cells and typhoid bacteria (Liebermann) 3286; fat metabolism of cell, tested with fat-partial, of tubercle bacillus (Much)

Digitized by Google

3286; cellular processes in latent period (Weil) 3293.
Antimonic acids, substituted amino aromatic (Chem. Fab. v. Heyden) P 3330.
Antimonite, detg. Sb by oxidation of (Gastaldi) 572.
Antimony, sepn. of Pb and (Hesse) P 595; production in 1913 (Hess) 905; allotropy of (Cohen) 1267; physico-chem. studies (Cohen) 2339; and war, 2504; m. p. (Kaye) 3161; replacement of N by, in piperidine (Grüttner) 3247.
Antimony, analysis, sepn. from Cu and Pb (McCay) 277; by oxidation of antimonite (Gastaldi) 572; (Cowan) 586; quant. 871; in alloys (Stief) 898; sepn. from As and Sn (Hahn) 2747.
Antimony, metallurgy of, electrolytic refining (Betts) 2838.
Antimony alloys, Untersuchungen über Lagermetalle, Antimon-Blei-Zinn-Legierungen (Heyn, Bauer, book) 906; with Sn and Pb (Bauer) 3203.
Antimony chlorides, chlorination of cyclic ketones with $SbCl_5$ (Eckert) 86, 1465; electrolysis of $SbCl_3$ in presence of colloids (Mazzucchelli) 1008; PCl_5 as solvent (Moles) 2342.
Antimony compounds, org. (Farbw.) P 694; absorption spectra of (Crymble) 3164.
Antimony oxides, reduction by Sb_2S_3 (Schoeller) 1017; Sb_2O_3 in glass manuf. (Springer) 2135.
Antimony preparations, tests of purity of medicinal (Pagniello) 2287.
Antimony sulfides, reduction of Sb_2O_3 by (Schoeller) 1017; treatment of Au ore contg. (Moore) 2502.
Antioxidase of tomato (Lubimenko) 2101.
Antipyretics, ineffectiveness against adrenaline (Mansfeld) 2945.
Antipyretic substances, effect of direct heating and cooling of heat center on temp. action of diff. (Hashimoto) 2268.
Antipyrine, manuf. 234, 2285; estg. caffeine and, in admixt. (Emery) 1972; transformation into diantipyrylmethane (Astre) 2290; *p*-chloro-*m*-cresotinate (von Walther) 2642; neutral salt compds. of (Pfeiffer) 2653.
Antipyrine dimethylarsinate (Barthe) 1530.
Antipyrine methylarsonate (Barthe) 1529.
Antiricin (White) 1530.
Antisensitisation (Weil) 102.
Antiseptics, hexamethyleneamine as urinary (Levy) 335; diff. behavior of carboxylase and zymase towards (Neuberg) 472; soaps (Schülke, etc.) P 531; sterilization of soil by (Buddin) 834; (Waterman) 1929; insol. (Rénon) 1929; detecting, in meats (Marre) 2111; HClO (Smith) 2919; in treatment of infected wounds (Dakin) 2943; history of ("Chemicus") 3328; picric acid as (Tidy) 3328; (Bayer & Co.) P 3330; see also *Disinfectants*.
Antiserum, passive sensitization with (Friedberger) 101; sp., for grains (Thöni) 490; for cancer (Berkely) 2552; toxicity and hemotoxicity of (Nicolle) 2552; see also *Blood serum*.
Antithrombin, temp. and action of (Howell) 811; test for, in blood (Hess) 1187; origin (Denny) 2932.
Antitoxins, Die Bindungsgesetze von Toxin und Antitoxin (Michaelis, book) 91; normal diphtheria, in mother and newborn (Gröer) 103; action of rattlesnake serum on rattlesnake venom (Welker) 2671; prepn. of tetanus (Ruediger) 2911; partial synthesis of (Ostromialenskii) 3090; action of cholera and typhoid, on suprarenal cells (Demetrescu) 3291.
Antitrypsin method and Abderhalden reaction (Freund) 92; serum (Kirchheim) 656; of blood serum with leucocytolysis by Th X (Rosenow) 820; serum, in Abderhalden test (Bronfenbrenner) 1924; Abderhalden test rendered negative by additions of serum (Bronfenbrenner) 3292.
Antitryptic power of blood serum (Visco) 212.
Ants, destruction of cable by white 1407.
Aorta. See *Blood vessels*.
Apatite from magnesite quarry (Grosspietsch) 1889; geology of, deposits of Virginia (Watson) 2861.
Aphis, control of wooly, by Duval's method (Liévre) 3114.
Aplotaxene (Semmler) 212.
Apnea (Githens) 1933.
Apocynum cannabinum, active principle (Windaus) 2378.
Apomorphine, test for (Grimbert) 1368; series (Tiffeneau) 1912; reactions (Beckers) 2794.
Apotoxin (Behring) 221.
Apparatus for introducing viscous liquid into grooves (Lyttleton) P 137; repair (G. B. O.) 537; glass for chem. (Schott) P 1103, 2300; Mechanical Appliances of Chem. and Metallurgical Inds. (Nagel, book) 1137; quartz-glass (P. A.) 1557; inner paraffin coating for volumetric (Povarnin) 2198; for treating flowing liquid (Ornstein) P 2727; see also *Colorimeter; Photometer; Spectrometer*, etc.
Apparatus, distillation, Chenard's tube for multiple fractionation (Hildt) 2; for H_2O 538; in theory and practice (Schröder) 538; vacuum (Heiduschka) 538; lab. (Chenard) 1261; vacuum Hg (Rohn) 1262; fractional distn. with regulated still heads (Rosanoff) 1422; indicator stopper for (Ferraro) 2165; home-made still, 2611; Kjeldahl (Pickel) 2725; receiver for fractional distns. under diminished pressure (Bogert) 2725. *Patents:* for NH_3 (Wright) 3 (Duncan) 129; for H_2O (Daley) 3 (Manahan) 2414 (Bassett) 3314; (McClelland) 258; petroleum (Humphreys) 374; regulating pressure in (Rogers) 375; for oils (Luhr) 375 (McElheny) 2167; for slimy liquids (Wolters) 398; (Gasser) 874; (Bateman)

Digitized by Google

1560; elec. heated (Brodie) 1707; for tar, oils, etc. (Crossley) 1707; for alc. liquors (Pampe) 2563; (Obrador) 2826; rectifying column (Soc. Barbet) 3147; for turpentine (Ziebols) 3369; see also *Condensers; Rectifiers.*

Apparatus, electric, for removing boiler scale, 3; brushes (Becker) P 28; for measuring small liquid resistances (Bräuer) 397; oil transformers (Weiss) P 1012; explosion of transformers, 1117; in theory and practice (Murdock, Oschwald, book) 1707; (Craig, Woodward, book) 1713; Theory of (Bedell, Pierce, book) 1720; Hg-jet interrupter (Bigge) P 1721; for detg. vapor d. (Mattern) P 2010; elec. porcelain (Creighton) 2035; interrupter of elec. currents (Burstyn) 2190.

Apparatus, extraction (Balderston) 251; for liquids heavier than solvent (Moreschi) 397 (Greenwald) 2165 (Janensch) P 2439; fat extn. tube (Butt) 538; for oil (Herburger Eisen, etc.) P 1402; for sugar from beets (Paschen) P 1407; color due to Cu (Greaves) 2723.

Apparatus, gas, for bringing gas and liquid into reaction (Chew) P 1138; testing (Webster) P 1410 (Haber) P 2612, 3354; for conveying and compressing (Wegmann) P 1863; (Central stelle, etc.) P 2727; see also *Gas, analysis; Gas, illuminating and fuel, apparatus.*

Apples, evapd. (McGill) 227; sprayed with Pb arsenate (Woods) 503; soils of Mass. and Conn. with reference to (Wilder) 1650; glass (Paris) 1811; sirup (Gore) 2112; prepg. sirup from juice (Gore) P 1952.

Apricot, kernels in marchpane (Lehmann) 2783.

Aqua regia, chlorination with (Kempf) 85; production of chloropicrin by action of, on org. compds. (Datta) 1063.

Aqueous humor, *n* of, after treatment with $CaCl_2$ (Tristaino) 2905.

Arabia sinensis (Kondo) 1092.

Arabinose, cupric reducing power of (Daish) 41.

Aralia cordata (Miyake) 2395, 2774.

***l*-Arbitol,** test for (Mandel) 3081.

Arc, electric. See *Electric arc.*

Arduinite (Billows) 3194.

Arecolidine and salts (Emde) 2087.

Arenicola, reversibility of geotropism of, larvae by salts (Kanda) 664.

Argaldine, 1828.

Argentite crystals (Grill) 2857.

Argentum colloidale, estg. Ag in (Korndoerfer) 508; evaluation of (Warnecke) 1092.

Argentum proteinicum, estg. Ag in (Korndoerfer) 508; evaluation of (Warnecke) 1092.

Arginase (Clementi) 1492, 1501, 2909.

Argon, velocity of sound in (Streider) 553; detg. in A-N mixts. by liquid air (Hamburger) 772, 1158; red spectrum of (Paulson) 882; ignition-points of mixts. of electrolytic gas with (Crofts) 1573; equation of state of (Holborn) 3149; capillary consts. for liquid (Crommelin) 3157.

Aristol, prepn. 3327.

Armor plate, alloy for (Churchward) P 438; metal (Soc. Firminy) P 439.

Aroma of hops (Schmidt) 1657.

Aromatic acids. See *Acids.*

Aromatic alcohols. See *Alcohols.*

Aromatic aldehydes. See *Aldehydes.*

Aromatic compounds. See *Organic compounds.*

Aroxyls (Pummerer) 316.

Arrester, high voltage (Peck) 1008.

Arsenates, colloidal (Klemp) 1142 (Deiss) 1416.

Arsenation of org. compds. (Roeder) 305.

Arsenic, m. p. of (Rolla) 183; and growth of bones (Eeckhout) 225; distribution in human body (Underhill) 337; fixation by brain after injection of salvarsan (McIntosh) 484; excretion in urine after subcutaneous or intravenous injection of salvarsan (Irokawa) 486; dipping fluids (Holborow) 503 (Chapin) 2419; explodable substance contg. (Müller) 715; antidote (England) 843; in 1913 (Hess) 905; and N-fixing powers of soil (Greaves) 946; in ossein and gelatins (Cochet) 1133; in spinal fluid (Hall) 1509; in agriculture (Cutolo) 1654; insecticides contg. (Sonntag) 1819; herbicides (Dubief) 1973; cod liver oil (Jannsen) 2128; in wall-papers (Schulz) 2310; distribution in liver in poisoning (Ryan) 2403; removing, from H_2SO_4 and $CuSO_4$ solns. (Martin) P 2488; deposition in hair (Heffter) 2779; mechanism of action of (Neuschlosz) 2934; replacement of N by, in piperidine (Grüttner) 3247.

Arsenic, analysis, Bettendorff's reagent (Vanino) 38; purifying agent for As solns. (Chapin) 40; sepn. from W (Dieckmann) 185; in Bi preps. (Enz) 236; sepn. of Zn, Cu and Fe from (Balls) 277; (Ericsson) 278; in H_2SO_4 (Nissensson) 278; Marsh (Rind) 278; in organs and org. fluids (Joachimoglu) 661; assay of, dipping fluids (Chapin) 686; (Billeter) 769; in alloys (Stief) 898; (Jannasch) 1286; in wine made from grapes subjected to cuproarsenical treatment (Garino) 1526; in Fe, steel and ores (Kleine) 1588; in residue from soln. of Fe and steel (Brandt) 1589; limit tests for (Tocher) 1664; detn. of minute amts. (Ramberg) 2040; in org. compds. (Barthe) 2041 (Mandel) 3043; in Pb (Brandt) 2203; (Palme) 2493; soda-KCN method (Klason) 2493; sepn. from Sb and Sn (Hahn) 2747; (Browning) 3041; biol. test for (Prinz) 3266.

Arsenic acid, titration with (Valentin) 1724; toxicity of (Joachimoglu) 2944.

Arsenic alloys, Bi-As (Heike) 778; f. p. of, with Ag (Heike) 2374.

Arsenic compounds, org. (Roeder) 305 (Boon) 353 (Farbw.) P 694; action on organism (Ullmann) 336; heavy metal addition compds.

Digitized by Google

of aromatic (Farbw.) P 514, 1976; of polyhydric alcs. (Hoffmann-La Roche) P 1097; azo dye contg. (Farbw.) P 1124; aromatic (Karrer) 1333, 2535 (Bayer & Co.) P 1830; and enzymic processes (Santesson) 2097; and Rous chicken sarcoma (Punk) 2109; of phosphatides (Hoffmann-La Roche & Co.) P 2568; compds. of As_2O_3 (Schreinemakers) 2744; pathol. action on adrenals (Brown) 3099; absorption spectra (Crymble) 3164; renal lesions produced by (Pearce) 3296.

Arsenic deposits, genesis of (Beutell) 190.

Arsenic oxides, compds. of As_2O_3 (Schreinemakers) 1566, 2744; v. p. of As_2O_3 (Welsh) 2210; As_2O_3 as alkalimetric standard (Menzies) 2628.

Arsenic preparations. See *Arsenic compounds*.

Arsenic sulfides, distribution of colloidal As_2S_3 between 2 liquid phases in system: water–ether–alc. (Corliss) 169; concn. of As_2S_3 sols (Kruyt) 2022; decolorization of colloidal soln. of As_2S_3 (Peskov) 2170; treatment of Au ore contg. (Moore) 2502; coagulation of As_2S_3 sol by electrolytes (Mukhopadhyaya) 2616.

Arsenious acid, volatilization from solns. contg. HCl (Smart) 277; assay of (François) 1974; toxicity of (Joachimoglu) 2944.

Arseno-azo compound (Ehrlich) P 354 (Farbw.) P 1975.

Arsenobenzoic acids, *o*- and *p*-, and derivs. (Michaelis) 2247.

Arseno-metal preparations. See *Arsenic compounds*.

Arsenopyrite from Rozsnyo (Zimanyi) 3192.

Arsine, action of Ra rays on mixts. of O and (Reckleben) 2837; hydrate (Forcrand) 3184.

Arsinic acids, sec. aliphatic-aromatic, and their reduction products (Bertheim) 1337.

Artemisia absinthum oil (Paolini) 1323.

Arteries, exptl. disease (Denny) 480; action of opium alkaloids on coronary (Macht) 2402; effects of epinephrine on splanchnic and peripheral (Hartman) 3285; see also *Blood vessels*.

Arteriosclerosis, butyric acid and (Coleman) 2105.

Arthritis and Na salicylate (Davis) 1640.

Arthropods (Gózony) 1197.

Arundo donax cane as paper-making fiber (Beveridge) 714.

Arylamides, rearrangements in (Witt) 307; Ueber Umlagerungs-Reaktionen bei Arylamiden der *m*-Nitrobenzolsulfonsäure (Truttwin, book) 1919; condensation products from, of 2,3-hydroxynaphthoic acid (Griesheim-Elek.) P 1998.

Arylaminoanthraquinone derivatives (Farbw.) P 3368.

Arylcinchoninic acids (Chem. Fab. E. Schering) P 2970.

Aryldiazo compounds of B and F (Bart) P 1830.

Aryl-*m*-dinitrosalicylic acids (Purgotti) 70.

Arylidenedimethylpyrones, constitution of, and salts (Boon) 63, 2893.

α-Arylisatin (Bayer & Co.) P 866.

2-Arylquinoline-4-carboxylic acids (E. Schering) P 127.

Arylsulfamides, reduction by HI (Fischer) 1057.

Arylsulfonamides, acyl derivs. of (Bückel) P 2130.

Arylsulfur chlorides (Zincke) 54.

Asbestos production in 1913 (Diller) 515; gel filtration of ultramicroscopic particles—action of (Coplans) 1341; mixing cement with fibrous (Nesetril) P 1680; filter (Grossfeld) 1724; waterproofing, mill-board (Moeller) P 1977.

Ascarides, toxicity of (Brinda) 1509.

Ascaridolic acid resolution (Nelson) 455.

Ascaris, effect of CO_2 on eggs of (Painter) 3303.

Ascension theory and epigenesis in ore deposits (Sachs) 579.

Ash, treating furnace (Müller) P 144; of colostrum milk (Sato) 669; as source of potash (Russell) 684; removing from gas generators (Gas Gen., etc.) P 859 (Stettiner Chamottefab., etc.) P 1841; of pistachio (Ricciardi) 867; detns. on digitalis (Newcomb) 1094; in unofficial drugs (Newcomb) 1094; in stools with atropy of infants (Nobécourt) 1200; detg., in coal and coke (Weisser) 1238; detg., in bread (Cutolo) 1354 (Scheringa) 1642, 2951 (Fillipo) 2950 (Zylstra) 3304; anthocyanin in (Czartkowski) 1798; mixing coke, with wash water from coal (Mack) P 1841; of vanilla ext. (Winton) 1946; algae (Klingbiel) 1831; detn. in coke (Eastaugh) 2305; fusibility of coal, in mixts. of H and water vapor (Fieldner) 2808; field app. for detg., in coal (Lesher) 2976; osmosis of, of clam muscle (Meigs) 3302; wines with slightly alk. (Baragiola) 3321; see also *Mineral matter*.

Asparaginate, agar (Conn) 470.

Asparagine, retention in phlorhizin diabetes (Nitsche) 1076.

Aspartic acid, estn. in products of protein hydrolysis (Foreman) 636.

Aspen, soda pulp (Surface) 149.

Aspergillus, enzymes of *A. oryzae*—in fermentation ind. (Takamine) 117; N assimilation in (Zaleski) 1796; enzymes of *A. turricola* (Scales) 330; protective action of $MgCO_3$ or $CaCO_3$ for *A. chroococcum* (Lipman) 837; autolysis and mycodextran content of *A. niger* (Dox) 814; influence of medium on action of inulase of *A. niger* (Kiesel) 923; *A. niger* in media contg. Cu, U and V (Javillier) 924.

Asphalt, chem. and analysis of (Marcusson) 146; heating and mixing (Guelich) P 147; methods of working up (Sabini) 373; detg., in petroleum (Holde) 373 (Gurvitch) 1111; m. pa. (Müller) 373; substitute (Radcliffe)

Digitized by Google

P 376; colloid chem. of (Rosinger) 1112; production statistics (Day) 1112; granulating (Stevens) P 1245; lubricants of Pechelbronn (Schultz) 1245; burning (Stewart) P 1386; chemist and, ind. (Rake) 1389; mixing heated, with aggregate (Bledsoe) P 1541; natural and art. (Marcusson) 1545, 1993; rock (Snider) 1545; Trinidad, and dispersoid chemistry (Richardson) 1711; theory of perfect sheet, surface (Richardson) 1993; Sources and Utilizations (Boorman, book) 1842; materials for street pavement (McLaughlin) 2138; in Philippines (Boomer) 2450; purchase on bitumen basis (Broadhurst) 2977; allowable max. penetration of, for bituminous pavements (Pullor) 2977; chemistry of, esp. photochem. properties (Gödrich) 3127; as protective coating (Rohland) 3134; see also *Bitumen*.

Asphaltites (Marcusson) 146.

Asphyxia, lactic acid in urine and blood after (Ishikawa) 1349.

Aspidium, oleoresin of,—adulterations (DuMez) 2288.

Aspidosine and -HI (Ewins) 606.

Aspidospermine (Ewins) 606.

Aspirator (Vigreux) 1409; of uniform rate of flow (Gautier) 3123.

Aspirin, amblyopia (Jacobs) 107; hydrolysis (Tsakalotos) 787; formation of (Tsakalotos) 2228.

Assaying, wood-burning furnace (Tays) 3; in Theory and Practice (Wraight, book) 280; Text-book of Practical (Park, book) 1020; galenicals (Hostmann) 1532; pharmacodynamic (Pittenger) 1532; blowpipe, in the field (Delius) 2040; balance, 2470.

Assimilation of nourishment by yeast cell (Rubner) 93; of C and N compds. by molds (Kossowicz) 641; $CHCl_3$ and chlorophyll (Körösy) 642; secretin and sugar (Loeb) 650; of colloidal Fe by rice (Giles) 682; of monosaccharides in ovariectomized dogs (Artom) 926; effect of shading on, of tobacco plant in Cuba (Hasselbring) 1629; chem. adjustments of (Willstätter) 2922; by green leaves (Willstaetter) 2923; of cholesterol and its esters (Mueller) 2926; spleen as Fe assimilative organ (Chevallier) 2933; of CO_2 by plants (Raikow) 3086; intracellular, in amphibian embryos (Coghill) 3102; see also *Carbohydrates; Nitrogen; Proteins*, etc.

Association in liquids (Partington) 548; of aq. $HgCl_2$ (Linhart) 878; temp. and, of acids in C_6H_6 (Szyszkowski) 2015; between ions and solvents (Quartaroli) 2017.

Asthma, β-imidazolylethylamine and (Eustis) 3094.

Astrol (Kossel) 2947.

Asymmetric atom. See *Atoms*

Asymmetric induction, prep. of *l*-benzaldehyde by (Erlenmeyer) 58; in case of BzH (Wedekind) 629.

Asymmetric synthesis. See *Synthesis*.

Asymmetry, asymmetric tervalent N (Moore) 2892.

Ateeamite, action of KOH on (Chumanov) 3039; interaction with NH_4Br (Chumanov) 3185.

Atheroma epinephrine (Leersum) 819; cholesterol (Bailey) 3293.

Atherosclerosis, expti. alimentary (Leersum) 2940.

Athletes, metabolism of (Benedict) 1496.

Atmometer (Livingston) 2009.

Atmosphere, absorption of solar radiation by earth's (King) 13; conditions of, and formation of active principle of digitalis (Burmann) 353; Ra A in, at Seeham in 1913 (Schrödinger) 411; moisture of, and drying of linseed oil (Fritz) 1397; of soil (Russell) 1648; O in (Leduc) 2169; radioactivity of, at Manila (Blackwood) 2187; radioactivity of (Jacot) 2187; variation of amt. of Ra Em in (Wright) 2484; extinction of ultraviolet light in earth's (Kron) 2622; relation of O tension of, to combustion (Dallwig) 2828; see also *Air; Nitrogen fixation; Oxygen*.

Atomic charges, at. numbers and (Sanford) 1413.

Atomic forces and calcn. of mol. dimensions (Laar) 400.

Atomic heat, photoelec. const. and (Sutton) 1873.

Atomic numbers, ordinals or (Broek) 22; Röntgen radiation and (Broek) 552; and at. charges (Sanford) 1413; plotting sepn. of homologous pairs of spectrum lines against (Ives) 2031.

Atomic structure. See *Atoms*.

Atomic volume, cohesion and (Ludwik) 983.

Atomic volume method, application of Traube's, to binary mixts. (Atkins) 2728.

Atomic weights, ann. rept. of comm. on (Baxter) 983; calcg. (Warrington) 1413; of radioactive emanations (Debierne) 1428; integral (Dodd) 2336; standard, for elements (Waddell) 2613; Ueber das Atomgewicht des Tellurs und seine Beziehung zu den Gruppenhomologen (Pellini, book) 2836; rept. of intern. comm. on (Clarke) 3148; electromagnetic inertia and (Nicholson) 3170; see also the elements, as *Bromine*.

Atomizer, color (Heinrich) P 2011, 2320; for oil-firing (Essich) 3356.

Atomizing paint on a surface (Levy) P 1125; hydrocarbons (Stuart) P 2979.

Atoms, refraction (Heydweiller) 16; structure of (Broek) 19 (Barlow) 20 (Eve) 22, 1004 (Crookes) 752 (Harkins) 2334, 2335, 2336; content and structure of (Stewart) 399; hypothesis of compressible (Richards) 399; existence of nucleus (Cole) 410; magnetic field of, and spectral series (Allen) 753; series spectrum of H and structure of (Allen) 753 (Bohr) 1005 (Vegard) 2484; Molecules, atomes et notations chimiques (book) 886; Elektrische Spektralanalyse Chemischer

Digitized by Google

Atoms (Stark, book) 1004; gyroscopic theory of (Crehore) 1005; and ions (Thomson) 1412, 1560, 1710; "small vibrations" in, -dynamics (Seeliger) 2012; Thomson's theory of, applied to structural chem. (Szyszkowski) 2012; distribution of electrons in (Compton) (Bragg) 2034; consts. (Allen) 2337; radiations from exploding (Rutherford) 2350, 3168; construction of cubic crystals with theoretical (Crehore) 2473; at. model (Allen) 2483; exchange of, between solids and liquids (Hevesy) 2485; new proof of asymmetric C (Fischer) 2521; no. involved in emission of spectrum lines (Ladenburg) 2621; cyanides of W and Mo—valence of central, in their complex anions (Rosenheim) 2743; Stark effect and structure (Fulcher) 3000; (Pagliani) 3016; quantum theory of radiation and structure (Bohr) 3016; dissociation of H into (Ismardi) 3161; Principien der Atomdynamik (Stark, book) 3168; photographic effect of recoil (Wood) 3169; optical activity without an asymmetric C atom (King) 3227.

Atophan, uric acid of blood and (Fine) 105 (Frank) 660; diazo-reaction in, urine (Greinert) 661; in gout and iritis (Smith) 1201; and power of nephritic kidney for eliminating uric acid (Fine) 3091; see also *Phenylquinolinecarboxylic acid*.

Atoxyl action on fowl spirochetes (Aoki) 223; and serum (Terry) 935; transformation in blood (Terry) 935; see also *Arsenic compounds*.

Atropa belladonna. See *Belladonna*.

Atrophy, energy exchange and metabolism of atrophic infant (Bahrdt) 647; urea content of cerebrospinal fluid and ash in stools with, of infants (Nobécourt) 1200; and acceleration of tissue enzyme action (Morse) 3293.

Atropine, idiosyncrasy of eye to (McEnri) 107; and digestion of meat (Tysebaert) 225; and respiration (Edsall) 336; loss of pharmacologic power on standing (Simon) 953; analysis by H_3BO_3 method (Winkler) 1157; effect of (Petzetakis) 1942; effect of diff. epinephrine compds. on arterial pressure of dog which had received (Tiffeneau) 3099; color reaction for (Wasicky) 3190.

Attraction of cohesion and of gravitation of mols. (Mathews) 400; Gurvich's hypothesis of physico-chem. attractive force (Kolosovskii) 2475; physico-chem. (Gurvich) 3003.

Audion (Armstrong) 177.

Augites, compn. of aluminous (Tschermak) 1447 (Boeke) 2045; law of admixt. (Tschermak) 2496.

Auricalcite (Kato) 2859.

Auricle, digitalis action on isolated frog (Straub) 2945.

Autochromes, intensifier for 272.

Autoclave test. See *Cement testing*.

Autoimplantation of kidney tissue (Katz) 483.

Autolysis, sterile, of blood and production of hemosiderin (Leupold) 99; post-mortem (Aschoff) 222; functional activity and, of brain (Soula) 647; following nephrectomy (Fedeli) 652; of kidneys (Simon) 657; and mycodextran content of *A. niger* (Doz) 814; changes in P-compds. of muscles during (Costantino) 1073; I and (Kepinov) 1509; effect of $MnCl_2$ on liver (Bradley) 1920; and involution (Morse) 2404; relation between creatine and creatinine in autolyzing tissue (Myers) 2662; autolytic products and tumor growth (Rhodenburg) 2669; of liver (Bradley) 2768; change in alc. and aldehyde content of yeast during (Neuberg) 3084.

Auto-oxidation. See *Oxidation*.

Autovaccines. See *Vaccines*.

Auximones, bacterial test for (Bottomley) 3081.

Auxochromes, addn. of, in flavone group (Perkin) 1311; and phototropy (Padoa) 1319.

Avena sativa, action of H and some anions and of isolated chlorides on (Plate) 1070; action of electrolytes on (Plate) 1799.

Avidity in non-aq. solns. (Rimbach) 7.

Avocado (Condit) (Jaffa) 2553; compn. of Hawaiian (Thompson) 3104.

Avogadro, Memoirs (book) 886.

Avogadro's constant, detg. *N* (Fletcher) 1413; detg., and electronic charge (King) 13; capillary layer and (Bakker) 736; detg. *Ne* for H (Eyring) 2182.

Axinite (Wherry) 42.

Azeotropic mixtures of EtOAc and H_2O (Lattey) 613.

Azibutanone (Diels) 1180.

Azides, explosive properties of (Wöhler) 1115; of org. acids (Curtius) 1605, 2765.

Azido-oxalic acid, Et ester (Curtius) 2766.

***o*-Azoacetophenone**(?) (Bamberger) 1781.

1 - [Azobenzeneamino - *p* - azobenzene - *p* - azomethinbenzyl] deriv., and -HCl (Lugner) 1465.

Azobenzene nitrate (Reddelien) 1911.

Azobenzene picrate (Reddelien) 1911.

Azo compounds, color and constitution (Hewitt) 204; of the pyrazole series (Mohr) 1173; mechanism of formation (Charrier) 1316; see also *Dyes, azo*.

4-Azo-5,5'-dichloropyrazole and MeCl deriv. (Michaelis) 1031.

***p*-[Azodiethylaniline]-benzoic acid** derivs. (Jacobs) 2075.

Azo dyes. See *Dyes, azo*.

Azostilbenediarsonic acid (Karrer) 1333.

Azotization by chloroamine (Forster) 1313.

Azotobacter, N-binding by (Hanzawa) 93 (Reed) 2417; soil org. matter as culture medium for (Mockeridge) 3082; in Danish woods—value for detn. of lime requirements in woodland (Weis) 3112; effect of org. soil constituents on N fixation by (Reed) 3317.

Azoxine dyes (Kehrmann) 625, 626.

Azoxybenzene, new derivs. of (Valori) 1475.

Azoxyphenols (Angeli) 65, 617.

***p*-Azoxyphenyl ethyl ether** and Ac deriv. (Angeli) 65, 66.

Digitized by Google

Azoxystilbenediarsonic acid (Karrer) 1333.
Azulene (Sherndal) 596; and picrate (Sherndal) 2089.

Babbitt metal, Cu in (Hagmaier) 772; (Tuspin) 905.
Babcock test, bottles for, 419 (Phillips) P 3310.
Babingtonite (Fenner) 425.

Babia (Bennett) 533.

Bacillus, gas, and digestive disturbances of childhood (Sylvester) 2664; yoghurt (Duchacek) 2920; **B. acidi lactici**, ice cream contg. (Odle) P 227; acidifying beet pulp with cultures of (Urban) 392; diabetes mellitus treated with (Henderson) 927; identification (Orla-Jensen) 1188; adaptation to medium (Richet) 2101; in cheesemaking (Gratz) 2116; **B. coli**, production of acids by, group (Browne) 217; ability to survive pasteurization (Ayers) 1353; proteolytic action of (Rosenthal) 1493; detn. in ice cream (Ayers) 1810; in pasteurized milk (Shippen) 1810; H ion concns. of, cultures (Clark) 2918; indole formation by (Fischer) 2920; **B. coli communis**, decomp. of formates by (Grey) 329; decomp. of glucose and mannitol by (Grey) 330; **B. delbrücki**, enzymic expts. (Euler) 472; in lactose- or glucose-contg. nutrient solns. (Palm) 473; acidification by, in sugar beet mash (Heinzelmann) 1090; **B. paratyphosus**, isolation from feces (Browning) 2915; **B. tuberculosis**, volatile substances from (Zueblin) 99; immunization against (Lindemann) 100 (Barber) 2668; absorption of fat-free (Hirsch) 106; metabolism of saphrophytic human, in various broths (Kendall) 215; lipase developed by rapidly growing—lipolytic activity and proteolysis of rapidly growing (Kendall) 217; test for viability of (Corper) 1340; function of spleen in exptl. infection of albino mice with (Lewis) 2937; fat metabolism of cell tested with fat-partial antigens of (Much) 3286; **B. typhosus**, isolation of (Houston) 640; temp. and vitality of (Houston) 640; sensitized *vs.* non-sensitized (Garbat) 932; pathogenic action of fowl (Smith) 1343; acid agglutination for recognition of (Michaelis) 2260; pyrogenic and antigenic action of proteins of (Sebastiani) 2551; pyrogenic action (Bergey) 2667; isolation from feces (Browning) 2915; antigen action of blood cells and (Liebermann) 3286; destruction in organism of rabbit (Hailer) 3302; **other species**, disinfection of hides infected with *B. anthracis* spores (Tilley) 1554; com. preps. of *B. bulgaricus* (Bendick) 1094; stain for *B. diphtheriae* (Kenyoun) 1343; *B. oxalatigenes* (Th. Sandro) 1495; destruction of paraffin *prodigiosus* (Greig-Smith) 1796; ctions in case of *B. proteus* (Baudet) ents of *B. pyocyaneus* (Nogier) on of *B. radicicola* from soil (Lipman) 947, 2120; effect of gentian violet on *B. tetanus* (Hall) 217; biol. hypothesis on deposition of S during chalk-S epoch of *B. ferrigenus* (Bargagli-Petrucci) 3045; see also *Bacteria*.

Bacillus carriers, fish as (Müller) 1518.

Back-firing, preventing, in tanks (Gaumer) P 2812.

Bacteria, action of glycerol on (Leiffert) 93, 1494; org. compds. as sources of C (Grimm) 93; origin of chromatin in (Ruzicka) 93; treating eggs, milk, etc., to destroy (Fox) P 110; of soils (Räuber) 115 (Conn) 835 (Greaves) 1215; acid-fast (Kendall) 215; K tellurite as indicator of (King) 215; classification for water analysis (Cornwall) 228; action of sunlight on, spores (Weinzirl) (Bazzoni) 228; yoghurt-, prep. (Brockhaus & Co.) 340; action of colored well water and inorg. salts on (Tully) 342; effect of diff. waters on (Tully) 342; detg., in soils (Conn) 470; gas formation by coliform organisms (Hall) 470; differentiation (Kirschbaum) 471; oxidation of $MnCO_3$ by (Beijerinck) 471; Studien über die Fortpflanzung von Bakterien, Spirillen und Spirochäten (Meirowsky, book) 473; antiferments (Jobling) 482; pathogenic, in river water and sewage (Houston) 496; action in soils (Rahn) 499; antagonism between anions as affecting soil (Lipman) 499; autotrophic C (Lieske) 640; behavior of soil, when heated in absence of air (Kühl) 640; organ exts. and (Marfan) 640; splitting of casein by, of milk (Barthel) 668; 37° and 20° plate counts for enumerating in water (Thomas) 677; of frozen soil (Conn) 683; oxidation of thiosulfates by (Lockett) 814; action of eosin on (Zeiss) 814; bacterial agglutinins (Krichevskii) 822; in heated milk (Ford) 827; sampling outfit for bacterial samples (Weston) 830; ammonification in soils by pure cultures (Lipman) 834; S and bacterial activities of soil (Vogel) 837; action of catalyzers on nitrifying (Montanari) 837; protein decomp. by (Breslauer) 920; agglutination reaction (Grote) 923; "tellurite reaction" (Davis) 923; inoculation of soils with legume (Fellitzen) 947; assimilation of N by, in soil (Schneidewind) 947; lactic-acid-forming, in manuf. and ripening of Cheddar cheese (Evans) 1079; milk feeding and intestinal flora (Rettger) 1191; mobilization of H_3PO_4 of soils under influence of (Severin) 1216; bacterized peat 1218; eatg. indole (Lewis) 1341; action of marine (Drew) 1343; behavior towards purified proteins (Sperry) 1344; production of lactic acid by acetic (Osterwalder) 1493; influence of Mn on nitrifying, of leguminous plants (Olaru) 1525; container for aerobic (Earp-Thomas) P 1628; oxidation of H_2S by (Jacobsen) 1628; reducing properties of acetic (Söhngen) 1628; destruction in milk by ultraviolet rays (Ayers) 1641; of Liptau cheese (Gratz)

Digitized by Google

1641; influence of temp. on microflora of hay (Gorini) 1642; antagonism between anions as affecting soil (Lipman) 1649; destruction of paraffin by (Greig-Smith) 1796; nutrition of marine (Coupin) 1928; detg. S in culture medium (Redfield) 1929; action of filtrates on tissues (Bittrolff) 1935; influence of condition of soil on (Christensen) 1961; effects of condensing and drying of milk on (Delepine) 2115; pure cultures in cheese-making (Gorini) 2116; filtration plant bacteriol. data (Scott) 2277; sterilizing cultures (Berthelot) 2394; action on tryptophan and indole (Herzfeld) 2394; rare earths and (Simonini) 2394; stain (Beintker) P 2395; vessels for growing (Hertha) P 2395; pathogenic members of typhoid-colon group (Smith) 2395; protozoa and, of soil (Goodey) 2417; air analysis (Ruehle) 2661; medium for testing for H_2S-forming (Chamot) 2678; typhoid and paratyphoid, in feces (Browning) 2915; Na boroformate and pathogenic (Köthner) 2919; action of lactic acid, on N compds. (Stutzer) 2920; fermentation of pyruvic acid by (Karczag) 2921; intestinal flora of rabbits fed on carrots and rabbits subjected to inanition (Rougentzov) 2921; bacterial test for plant food accessories (Bottomley) 3081; Fe (Harder) 3082; comparative rate at which fluorescent and non-fluorescent, are killed by ultraviolet light (Burge) 3083; biochem. study of pigments (Kligler) 3083; reciprocal relations of virulent and attenuated cultures in active immunization (Hadley) 3091; sp. enzymes for diff. constituents of bacterial cells (Hutyra) 3091; oral, and the teeth (Gies) (Kligler) 3094; resistance against antiformin (Spindler) 3269; of mouth and their relation to systemic disease (Stewart) 3291; Les microbes dan l'industrie laitière (Daire, book) 3309; see also *Bacillus; Culture mediums; Microorganisms; Nitrogen fixation; Sewage; Water, purification of.*

"Bacterial bed," non-bacterial population of (Crabtree) 499.

Bacterial products, rapid intoxication of rabbits by (Penfold) 1628.

Bacterial toxins. See *Toxins.*

Bactericide, lime as (Houston) 495; chrysarobin and medicaments used in psoriasis (Schamberg) 936; derived from $(CH_3)_4N_4$ (Jacobs) 1493.

Bacteriology (Hiss, Zinsser, book) 94; (Jordan, book) 94; der Nahrungs und Genussmittel (Kossowicz, book) 110; of soils (Brown) 347 (Voitkievicz) 2788; Soil (Burgess, book) 349; Pathology and (Roberts, book) 919; (Bolduan, Grund, book) 925; Exptl. Dairy (Russell, book) 1189; I microparassiti nelle malattie du infezione. Manuale tecnico di batteriologia (Bordoni-Uffreduzzi, book) 1189; purification of crude silk peptone for (Hall) 1342; incubator for (Hearson) P 1343; effects of green manures (Briscoe) 1362; of Emmenthaler cheese (Eldredge) 1947; control of feeding-stuffs for milk cows (Gorini) 2115; of fertilizer plats (Given) 2559; Praktikum der klinischen chemischmikroskopischen- und bakteriologischen Untersuchungsmethoden (Klopstock, Kowarsky, book) 2918; Chemisch-bakteriologisches Taschenbuch (Mindes, book) 2921; Apparate und Arbeitsmethoden der Bakteriologie (Reitz, Beiniker, book) 2921; of defective cheese (Thöni) 3306; see also *Water, analysis.*

Bacteriolysis, resistance of acid-agglutinated cholera vibrios to (Lanza) 471; phenomena of sensibilization (Porcelli-Titone) 1507.

Bacteriotoxins. See *Toxins.*

Bagasse, imbibition of (Pellet) 1132, 1701; stock food from (Walker) P 1813; detg. sugar in (Deerr) 2323 (Pellet) 2719; stoking with (Prinsen-Geerligs) 2722; paper-making fiber from (Lee) P 3358.

Bags, filtering (Playter) P 4; for enclosing food for cold storage (Kilner) P 3359.

Bakelite, suit decision 2317; (Matsumoto) 2317.

Baking, without grain flour (Fornet) 2406 (Ostwald) 2676; use of potatoes in (Neumann) 2407; modification of flour during (Kaining) 2780; baking qualities of flours (Harcourt) 2951.

Baking powder, egg albumen in (Jackson) 226; (Kressel) P 1355; estg. CO_2 in (Brubaker) 1730 (Macara) 2272; analyses (McGill) 2271; manuf. (Victor Chem. Works) P 2274; effervescent compn. for (Strickler) P 2783.

Balance, The Use and Care of (Krayer, book) 280; torsion (Voller) 982; micro- (Riesenfeld) 1557 (Emich) 2997; density (Schwarz) 1705; electromagnetic vacuum (Anderson) 2166; assay 2470; Heusser attachment for (Heusser) 2610; automatic, in study of enzyme reactions (Abderhalden) 3255.

Balata, resilient articles from gum (Petersen) P 163; sepg., from its saps (Colloseus) P 1860; in rubber compds., 2007; manuf. (Ter Laag) 2007.

Ballistics. See *Explosives.*

Ballistite, extn. of nitroglycerin from (Chiaraviglio) 2149.

Balloons, fabric for (Porritt) P 164 (Barr) 2007; varnish for 386; explosion 1393; H for inflating (Fourniols) 2294; NH_3 for filling (Sander) 2294.

Balsam, Colombian tolu- (Wielen) 2126; copaiva—hardwickia (Schimmel & Co.) 2692; com., of copaiba (Beckers) 2794.

Balsam fir, as pulp wood 714.

Bamboo, paper pulp or fiber from (Jardine) P 2311.

Bananas, comp. of ripening (Gore) 827; preserving (Heine) P 829 (Plunkett) P 1643; drying (Beth) P 2408; meal analysis 2952; compn. of Hawaiian (Thompson) 3104.

Bang method, for estg. blood sugar (Pearce) 3262.
Baptisia tinctoria (Clark) 2773; detection of baptisin in (Tunmann) 3326.
Baptisin, detection of, in *Baptisia tinctoria* (Tunmann) 3326.
Baptisol (Clark) 2773.
Barfoed's test (Welker) 2660.
Barite of Maryland (Grasty) 282; production in 1913 (Hill) 515; crystallography of (Manfredi) 575; sepg. from ores (Greenstreet) P 783; in the Hartz (Bentz) 902; of Appalachian states (Watson) 1022; structure of pyrite-, deposit as basis for geol. interpretation (Bergeat) 2861; see also *Barium sulfate.*
Barium, orthoclase contg. (Tschermak) 1447; infra-red arc spectrum of (Marshall) 3164; see also *Alkaline earth metals.*
Barium bromate, regular intergrowths of, crystals (Aminoff) 2474.
Barium bromide, compds. with betaine, etc. (Pfeiffer) 2652.
Barium carbonate, equil. $BaCO_3$-H_2O (Weissenberger) 10.
Barium chloride, systems formed by $SrCl_2$, $BaCl_2$ and NaCl or KCl (Vortisch) 182; system: (Ba-K-Na)Cl (Jänecke) 895 (Vortisch) 896; (Gardner) P 2433; compd. with sarcosine (Pfeiffer) 2653.
Barium compounds in glass (Silverman) 2134.
Barium cyanide, action of water vapor on (Rolla) 767.
Barium dioxaloacetatoaquochromiate (Werner) 37.
Barium dioxalodiquochromiates (Werner) 35.
Barium dioxalohydroxoaquochromiate (Werner) 36.
Barium hydroxide. (Rollin) P 698; in estg. tryptophan content of proteins (Homer) 3264.
Barium molybdenum semipentoxide and trihydrate (Mawrow) 2359.
Barium nickelomolybdate (Barbieri) 897.
Barium oxide, electrochem. production (Cambi) 755; manuf. (Newberry) P 1374 (Saunders) P 1977; see also *Alkaline earths.*
Barium radium sulfate, concg. Ra contents of, residues (Bredt) P 3028.
Barium sulfate, removing from ores (Greenstreet) P 132; as precipitant under diff. conditions (Moore) 2203.
Barium sulfide (Staszewski) P 358; continuous manuf. (Meyer) P 3340.
Bark, oxidation in apple (Rose) 2396.
Barkevikite (Scott) 1289.
Barley, ext. detn. in -autoclave (Engelhard) 119; of 1914 (Windisch) 120 (Koritschoner) (Wolfs) 350 (Ehrich) 690; sugars in (Kluyner) 505; proteins of, in grain and during brewing (Schjerning) 689; detg. mineral constituents in (Schönfeld) 690; of 1912-13 (Fürnrohr) 690; respiration of (Harman) 1088; humic substances on, husks (Weinwurm) 1088; streak disease of (Tritschler) 1363; faced pearl (Liverseege) 1516; Russian, ergot (Schneider) 1826; treating pearl, with SO_3 and talc (Plücker) 1949; $CaCN_2$ and germination of (Trnka) 1962; antagonism between anions and, yields (Lipman) 2281; formation and detn. of acids in (Lüers) 2283; starch detn. in (Wieninger) 3323; characteristic of, of 1915 (Koritschoner) 3325.
Barlow's disease. See *Scurvy.*
Barometer, conversion of, readings into pressure units (Covert) 17; modified precision (Germann) 257; gas (Gründler) P 398.
Barosma venusta, volatile oil of (Goulding) 460 (Umney) 844.
Barreswill solution (Pellet) 1699.
Baryta. See *Barium oxide.*
Barytes. See *Barite.*
Basalt, rocks of Medves Mts. (Emszt) 583; analcite (Washington) 583 (Pelikan) 3196; of the Reinhard forest (Apel) 775; inclusions in, tuffs and their minerals (Schadler) 1448; nepheline (Mansfield) 2634; of Marburg region (Schwantke) 2634; from Bohemia (Folgner) 3196; of Vogelsberg (Pfisterer) 3196.
Base, $C_7H_6N_2S$ and -HCl (Oliveri-Mandalà) 72; $C_{28}H_{28}N_2$ and chloroplatinate (Ishizaka) 76; $C_{18}H_{24}O_2N_2$ and -HCl (Ewins) 607; $C_8H_{16}N_2$ (Windaus) 623; $C_{18}H_{23}O_4N_3$ (Wohl) 1050; $C_8H_{17}NH_2$ and derivs. (Wallach) 1458; $C_9H_{11}N$, picrate (Plancher) 1478; $C_{29}H_{31}NBr_2(:NH)CO_2Et$ and chloraurate (Ciusa) 1479; $C_{17}H_{25}O_3N$ and derivs. (Petrenko-Kritchenko) 3052.
Basedow's disease. See *Goiter.*
Bases, palladonitrites of metals fixed by org. (Scagliarini) 33; Ueber einfache Pflanzenbasen und ihre Beziehungen zum Aufbau der Eiweisstoffe und Lecithine (Trier, book) 95; salt-like double compds. from org. (Farbw.) P 128; β,γ-unsatd. cyclic, and BrCN (v. Braun) 321; reactions of ions and mols. of (Schroder) 544 (Robertson) 2018 (Marshall) 3155; soils satd. with (Gedroits) 1215; base-exchanging products (Permutit-A.-G.) P 1235 (Brünn) P 2787; detg. very weak (Horiba) 1265; retardation of oxidation of Fe by (Rohland) 1454; formed on alkylating pyrroles (Plancher) 1477; org., and cathodic deposition of metals (Mazzucchelli) 1719; effect on oxidations in egg of sea urchin (Loeb) 1943; org., and the potential of H electrode (Mazzucchelli) 2026; effect on reaction velocity of Ph_2CH dyes (Biddle) 2092; interaction of dehydrobenzoylacetic acid with N (Shettle) 2508; displacement curves of org.,—detn. of alkaloids (Goubau) 2689; action of diphenylurea chloride on org. (Dehn) 2899; hexone, of malignant tumors (Kocher) 3095.
Basic properties of O in ethers (Chelintzev) 1755.

Bates, art. (Wood) 2162.

Bathing, metabolic influences of, in Great Salt Lake (Mattill) 1943; moor water of Schwartau 2410; "upper surface-subterranean" water for (Kühl) 2410.

Baths, CO_2 (Sarason) P 517, 3330; estn. of Pb in tinning (Breteau) 772; liquids of const. b. p. for use in const. temp. heating (Golodetz) 1424; active principle of S (Spindler) 1668; O (Hahn) P 2570; for producing etching resists (Dejey) P 2712; see also *Electrolysis; Thermostats.*

Bating, hides and skins (Rogers) 535; enzymes in, of skins (Wood) 3143.

Batteries. See *Cells, voltaic.*

Baubigny's method (Bekk) 2042.

Bauxite, in manuf. of refractories, 238; deposits (Mead) (Watkins) 2048; treatment of red (Fulloni) P 2804.

Bauxite (Artini) 2365.

Beaker, chem. lab. (Stephan) P 983.

Beamhouse, chem. control of (Helfrich) 2723.

Beans, oil extg. mill, 250; Bengal (Shrewsbury) 489; French, as a feed (Barnstein) 828; from Brit. W. Africa 1205; stock food from (Strauss) P 1813; HCN from haricot (Blair) 1949; *Canavalia spp.* 2953; HCN content 2953.

Bearing metals, Lagermetalle, Antimon-Blei-Zinn-Legierungen (Heyn, Bauer, book) 906; analysis of (Compagno) 1589 (Lutts) 1885; (Coho) P 1600; substitutes (Garlepp) 2571; of high elastic limit 2757; Pb-Sb-Sn alloys (Bauer) 3203; see also *Alloys.*

Bearings, standard specifications for, in railway wagons 586; self-lubricating (Loudenbeck) P 1099; compn. for (Aylsworth) P 1671; (Gen. Elec. Co.) P 2760; alloys for car journal (Clamer) 3211; standard alloy for railroad car (Clarke) 3211.

Beaters, power consumption of pulp (Schulte) 1114 (Nash) P 1843; for paper pulp (Cyster) 3129.

Beckmann rearrangement. See *Rearrangements.*

Becquerel effect (Goldmann) 14, 15, 1424.

Becquerel rays. See *Rays.*

Bedding, loose metal (Allgem. Elek.-G.) P 2133.

Bed metal (Guertler) P 1601.

Beechwood, detg. methoxyl in, tar (Blanes) 2688.

Beef. See *Meat.*

Beer, exam. of, and proposed standards (Hoyer) 118; detg. alc. and ext. in (Podlogar) 118 (Lehmann) 1090; "temperance" (Wahl) P 120; manuf. (Narjes) P 120; (Nathan-Inst., A.-G.) P 2124; top-fermented (Schönfeld) 506; yoghurt (Versuchs, etc.) P 506; detg. mineral constituents in (Schönfeld) 690; pineapple flavor in (Moritz) 690; sp. gr. of (Thorpe) 690; pasteurizing (Erikson) P 691; yeast in industry and therapy (Carlinfanti) 841; filter for (Bearman) P 843 (Youngman) P 1091; influence of mashing process, acidity, time of storage and type of yeast on ester content of (Windisch) 1089; color detn. of (Schnegg) 1222; scientific basis in production of (Weinwurm) 1527; non-alc. (Kroupa) P 1658 (Reiter) P 2563; charging, with gases (Lamsens) 1658; (Seibel) 1822; lactic acid in production of (Wahl) 2123; refinement (Wahl) 2123; flavoring (Hölldampf) P 2124 (Wahl) P 2687; transporting (Quarzlampenges) P 2124; compressed air for tapping (Schönfeld) 2284; enzymes in (Bau) 2284; detg. original gravity (Baker) 2562; reducing original gravity of (Petit) 2562; saccharimeters for analysis of (Rossi) 2562; sucrose in production of (Cluss) 2562; peroxidase in, yeast (Bach) 2659; low in alc. (Hinterlach) P 2791; carbonating (Wilkinson) P 2965; fermentation of (Windisch) 2965; $Ca(COO)_2$ in beers (Will) 2964; see also *Beverages; Brewing; Liquors; Wort.*

Beer extracts, saccharimeters in analysis of (Rossi) 2562.

Beeswax, detection of fat in (Ostrogovich) 1401; stearic acid in (Fischer) 2157; detecting paraffin wax in,—East Indian and European (Salamon) 2322; recovery of Ghedda (Fischer) 2989; Corean (Ueno) 2989.

Beet, distinguishing seed of feed, from that of sugar (Plahn-Appiani) 1131; see also *Sugar beet.*

Beet sugar. See *Sucrose.*

Beet sugar industry. See *Sugar industry.*

Bekinkinite and associated rocks (Tyrrell) 2863.

Belladonna, cultivation (Newcomb) 234; (Newcomb) (Farwell) 1093; evaluation of ext. (Herzog) 1365; (Unger) 1495.

Belloni apparatus (Livingston) 2009.

Bells, battery, signalling system (Wheeler) 2190.

Belting, multi-ply, of textile fabric (Burrell) P 129; rubber 1134; dressing for (Bakevich) P 1703; drying (Sibson) P 1703.

Bending tests, rotary and alternate (Nusbaumer) 1741; of cast Fe (Matsumura) 2216.

Benzalacetoacetic nitrile and semicarbazone (Mohr) 60.

Benzal-α-acetonaphthone and di-Br deriv. (Albrecht) 911.

Benzalanilinium hexabromo-osmiate (Gutbier) 1439.

Benzalanilinium hexachloroiridate (Gutbier) 1439.

Benzalbenzylphenylhydrazone peroxide (Busch) 806.

Benzal-*p*-bromophenylhydrazone peroxide (Busch) 806.

Benzal-*p*-chlorophenylhydrazone peroxide (Busch) 806.

Benzaldehyde, prep. of *l*-, through asym. induction (Erlenmeyer) 58; condensation of isoamylamine and (Ishizaka) 77; absorp-

tion spectra of various derivs. of (Purvis) 207; condensation with Et 1,3-dihydroxy-2-naphthoate (Nowak) 598; alleged activation (Wedekind) 629; action of polycyclic hydrocarbons (Frankforter) 909; condensation with α-naphthyl Me ketone (Albrecht) 911; xylylhydrazone, etc. (Padoa) 1318–9; condensation with glycerol (Irvine) 1468; solubility of, in cherry laurel water (Astruc) 1972; production by tyrosinase (Chodat) 2099; detg. in cherry brandy (Golse) 2686; 2-pyridylhydrazone (Fargher) 2890; mesil (Reddlien) 3247.

Benzaldehyde 2,4-dichlorophenylhydrazone (Chattaway) 1037.

Benzaldehyde nitrate (Reddelien) 1910.

Benzaldehyde picrate (Reddelien) 1911.

Benzaldoxime, absorption spectra of *syn-* and *anti-* (Valyashko) 2071.

Benzaldoxime *N*-benzhydryl ether (Alessandri) 1045.

Benzalethylammonium hexabromo-osmiate (Gutbier) 1439.

Benzalethylammonium hexachloroiridate (Gutbier) 1438.

Benzalglucosaminic acid, Et ester-HCl (Levene) 2078.

Benzalhydantoin, stereoisomerism (Johnson) 909.

β-Benzalhydrindonimine, -HCl (Leuchs) 3245.

Benzalmesidine (Reddlien) 3247.

Benzalmethylammonium hexabromo-osmiate (Gutbier) 1439.

Benzalmethylammonium hexachloroiridate (Gutbier) 1438.

3-Benzal-6-methylchromanone (v. Auwers) 85.

Benzalmethylsemicarbazide (Backer) 2383.

Benzalpeonol (Bargellini) 448.

Benzalphenylhydrazone peroxide (Busch) 805.

Benzal-*p*-tolylhydrazone peroxide (Busch) 806.

β-Benzaminoethyl methyl ketone and amide chloride (Gabriel) 2876.

Benzaminoisobutyrophenone (Bachstez) 629.

β-Benzaminopropiophenone (Gabriel) 2876.

Benzanilide-*o*-nitrophenyl ether (Mumm) 1485.

Benzanthrone compounds. See *Dyes, vat.*

o-Benzarsinic acid (Michaelis) 2247.

Benzene and active anaphylaxis (Schiff) 102; explosion of Fe, nitrating app. (Pikos) 152; compressibility of (Essex) 261; substitutes (Dieterich) 373; manuf. (Holcgreber) P 375; products in U. S. (Wigglesworth) 710; washing (Pepper) P 711; solubility in system: $AcNH_2$– (Moles) 743; bromination (Ducelliez) 787; combustion in explosion engines (Terres) 856; sepg., and its homologs (Koppers) P 962; recovery of, from coke-oven gases (Barnick) 1106; test for toluene in 1107; detg. in coal gas 1239; adsorption of soap in C_6H_6-H_2O interface (Briggs) 1414; coagulation in aplastic anemia of poisoning by (Hurwitz) 1503; action on blood and hematopoietic organs of, and its side-chain homologs (Bianchi) 1640; in prep. of tincture of I (Ceppellini) 1663; tar dehydration and, recovery (Bass) 1683; as fuel for internal-combustion engines (Watson) 1687; reaction of $(CH_2Br)_2O$ with (Rabtzevich-Zubkovskii) 1749; intoxication by, vapors (Heffter) 1805; systems: caoutchouc–alc.– and caoutchouc–acetone– (Caspari) 1868; 50 years' research on (Holleman) 1897; distribution of $C_6H_3(NO_2)_2COOH$ between H_2O and (Szyszkowski) 2014; hydration and association of acids in (Szyszkowski) 2015; surface tension (Richards) 2025; spectra of halogen derivs. of (Purvis) 2030; action of α-bromoisobutyryl bromide on (Kizhner) 2066; pharmacol. action (Neumann) 2105; equil. in system: urethan– (Pushin) 2176; system: H_2O–PhOH–C_6H_6 (Horiba) 2346; ultraviolet absorption of mono-derivs. of (Strasser) 2348; pump and filter for (Smith) P 2472; detg., in gas mixts. (Burrell) 2583; distn. of (Soc. E. Barbet, etc.) P 2707; substitution law (Baly) 2729; in the organs (Joachimoglu) 2917; detecting, in mixts. (Frank) 3044; purifying (Koppers) P 3353; discrimination of benzine and (Mix) 3356.

Benzeneazobenzeneazochloroacetyl - β - naphthylamine (Jacobs) 2073.

Benzeneazo - 2' - chloroacetylamino - 4' - dimethylaminobenzene (Jacobs) 2073.

Benzeneazo - *m* - chloroacetylaminophenol and deriv. (Jacobs) 2074.

Benzeneazomethananil (Busch) 2065.

Benzeneazo-β-naphthyl chloroacetate (Jacobs) 2077.

Benzeneazophenylurea (Sonn) 76.

Benzene derivatives, replaceability of substituents in (Holleman) 1174; simultaneous formation of *o*-, *m*- and *p*- (Fry) 1327; spectrochemistry (v. Auwers) 1459; absorption spectra and constitution of (Valyashko) 2070; crystalog. of nitro (Steinmetz) 2088; physiol. action (Filippi) 2670; absorption spectra of mono-substituted (Baly) 2729; solubility of certain disubstitution products (Sidgwick) 3226.

Benzene hydrocarbons. See *Hydrocarbons.*

Benzene ring, influence of substituents in, on velocity of reaction (Olivier) 442; substitution in (Holleman) 454; influence of NO_2 groups on substituents in (Kenner) 605.

Benzene series, phthalides of (Copisarow) 2519.

Benzenesulfonic acid, compd. of K salt with pyrocatechol (Weinland) 319.

Benzenesulfonylaminoazotoluenes (Morgan) 2894.

Benzenesulfonyl derivatives of *o*-aminoazo compds. (Morgan) 2894.

Benzenetricarbamic acid, tri-Et ester (Curtius) 1609.

Benzhydrol-2,4,2',4'-tetracarboxylic acid and lactone (Mills) 2521.

Benzylsiliconic acid, Na salt (Meads) 1907.
Beraunite (Wherry) 42.
Berberine, identification in plants (Mayrhoffer) 122; detn. (David) 1826; (Freund) 2872.
Bergamot, adulterant of (Coen) 2564; (Schimmel & Co.) 2692.
Beriberi, metabolic factors in (Braddon) 1192; prevention (Chamberlain) 1635; thymus gland in (Williams) 2668; treatment of human (Williams) 2668; treatment with ext. of tiquitiqui (Albert) 2929.
Beriedets (Puckner) 2128.
Berlin blue. See *Prussian blue.*
Bertrand method (Pellet) 2463.
Beryl (Wittich) 43.
Beryllium, morphotropic relations between salts of trivalent metals and those of Sc, In and (Jaeger) 990.
Berzelius, in history of science (Guareschi) 2169.
Bessemer process. See *Metallurgy.*
Betaine and -HCl (Anilin-Fab.) P 127, 356, 730, 1856; solubilities, etc., of, and its salts (Stoltzenberg) 296; alkaloid betaines (Frerichs) 616; and its salts (Anilin-Fab.) P 2463, 2464; (Weinhagen) 2230; a way from sugar to (Pringsheim) 2544; neutral salt compds. of (Pfeiffer) 2652.
Beta vulgaris. See *Beets.*
Bettendorf's reagent (Vanino) 38.
Beverages, fruit juice (Rossee) 109; detg. tartaric acid in (Häussler) 117; preserving (Aumont) P 120 (Milburn) P 2678; fermented (Busma) P 120 (Scott) P 843; ext. for (Kellogg) P 338; elec. treating (Henry) P 414, (Brodrick) P 843; alc. (Hallenberg) 951; aging and maturing (Vianna) P 951; MeOH in alc. (Franceschi) 952 (Takahashi) 3115; sol. product contg. Fe for addition to (Marsh) P 1081; testing carbonated (Alpers) 1812; effervescing (Gaucher) 2111; acidulated whole-milk (Dunn) P 2274; powder for prepg. (Kellog) P 2556 (Barnhard) P 2677; tannings used in (Repiton) 2561; non-alc. (Kaiser) P 2563 (Stitzel) P 2687.
Biacenaphthyl. See *Dinaphthylenebutane.*
Bicyclic bis-[iminonitrile], $C_{20}H_{16}N_4$ (Schlesinger) 74.
Bile, secretion (Pitini) 224 (Ignatowski) 820 (Okada) 3283; drugs and flow of (Reach) 336; influence of cholesterol on excretion of (D'Amato) 1800; toxicity of rattlesnake (Welker) 1806; therapeutic prep. from (Nöhring) P 1371, 3118; gallstones from thickening of (Rovsing) 1505; total solids of, of rattlesnake (Welker) 2671; chem. change in, in liver intoxication and its importance in pathogenesis of gall stones (D'Amato) 2939; detg., salts in urine (Allen) 3261.
Bile acids (Lifschutz) 650; constitution (Moreschi) 796.
Bile pigments and hemoglobin (Barratt) 479; reagent for, in urine (Travaillé) 1342; production outside liver (Van den Bergh) 1939; detecting, in urine (Lipp) 2260; (Küster) 2882; (Fischer) 3257; see also *Bilirubin*, etc.
Bilinite (Sebor) 190.
Biliobanic acid (Pringsheim) 3234.
Bilirubin, in albuminous fluids (Bergh) 1491; (Küster) 2882; production outside liver (Van den Bergh) 3098.
Bilirubinic acid, NH_4 salt (Küster) 2882.
Binary mixtures, viscosity in, aniline–allyl mustard oil (Kurnakov) 11; viscosity of, of nonelectrolytes (Scarpa) 170; mol. structure of (Tammann) 875; isotherms of diatomic gas (Onnes) (Crommelin) 988; vol. change and heat phenomena in formation of (Kremann) 1143; mol. structure of solid isotropic and anisotropic (Tammann) 1563; viscosities of, of H_2O, HCO_2H and AcOH (Davis) 1568; temp. coeffs. of surface tension in (Padoa) 1867; v. ps. and sp. vols. (Campbell) 2176; heating method in investigating eutectic (Bezborod'ko) 2179; relation between diagrams of fusion and viscosity of (Kurnakov) 2478; application of Traube's at. vol. method to (Atkins) 2728.

(Thevenot) 1365; sugar in (Jalowetz) 1657, disinfection in breweries (Moufang) 1823; Illustriertes Brennerei-Lexikon (Delbrück, *et al.*, book) 1825; mashing process (Kuhn) P 1825; and manuf. of invert sugar, etc. (Baudrexel) 2159; (Hessberg) P 2563; (Kuhn) P 2564; use of raw sugar in Austria (Weinwurm) 2686; brew water analysis (Zikes) 3115; utilization of, total waste for feeding (Ulrich) 3309; starch detns. in brewers' grains and barleys (Wieninger) 3323; "burtonizing," waters (Wahl) P 3325; prepg. grain for (Hehle) P 3325; see also *Mashing; Wort.*

Bricks, burning 136 (Moller & Pfeifer) P 1235 (Diener) P 2443; fire (Hidecker) P 136 (Patterson) 959; absorption of H_2O by building (Mahr) 139; clinker (Anon.) 238 (Taylor) 701; with aluminous clay bases (Bigot) 238; effect of steam on magnesite (Youngman) 238; natural cement *vs.* (Reibling) 364; cures for efflorescence, 700; fire, for gas retorts, 700; filling hardening cylinders (Drakebusch) 852; committee rept. on standard specifications (Bleininger) 958; diatom heat insulating 958; drying 959; and Art. Stones of Non-Plastic Materials: Their Manuf. and Uses (Searle, book) 960; formation of cryst. hematite during burning of (Hughes) 1587; preserving resisting quality of (La Soc. Utzschneider, etc.) 1676; brick testing on large piers (Griffith) 1677; kieselguhr (Caven) P 1836 (Hesselmeyer) P 2300; color of fire-, 1982; exam. of fire (Beckett) 2136; vitrified (Thomas) P 2300; production of sand-lime, in 1914 (Middleton) 2301; press (Müllenbach) P 2579; machines (Grote, A.-G.) P 2579; silica, for by-product coke ovens (Seaver) 2805; (Frick) P 2807; burning black flashed (Rathfon) 2973; prevention of efflorescence in finished, -work (Williams) 3341; quartz substitute for fire (Richter) 3341; glazing (Dennison) P 3344.

Bridges, concrete construction (McCullough) 239; alloy steel in (Waddell) 3210.

Brine. See *Salts.*

Brinell test, anisotropy of coarse-grained metals and alloys and (Portevin) 1596.

Briquets, binding power of flue dust for (Schumacher) P 439; for making cement (Schneider) P 1234; sulfite liquor binder (Pollacsek) P 1391; (Armstrong) P 1832; from fodder, hay, etc. (Mieczyslaw) P 3355; **fuel,** oil (Behrend) 243; coal (Malcolmson) 856 (Herbing) 2304; (Parker) 1106; Fohr-Kleinschmidt process (Dach) 2141; coke (Behr) 2144; plant of Nürnberg gas works (Terhaerst) 2809; from coke breeze (Behr) 3351; *Patents:* Coal (Comp. d'agglomérés, etc.) 145 (Cann) 369 (Evans) 370, 1840 (Richter) 522 (Vitrified Coal Co.) 859 (Babcock) 1108 (Meyer) 1108 (Diamant-Brikettwerke) (Grätz) 1388 (Phillips) 1544, 2705 (Schneider) 1685 (Rakowski) 1840 (Schumacher) 2376; (Fohr) 370, 708; furnace for prepg. (Unger) 708 (Gratz) 2977; binder for (Davis) 860; for reducing Fe ores (Loesch) 1028; furnace for coking binder in coal (Grätz) 1243; cooling brown-coal (Schlauf) 1387; preventing fire in stored (Grätz) 1388; peat (Testrup) 1685 (Ekenberg) 2306; (Alexander) 2146; ore (Hirsch) 776; *Patents:* (Crusius) 50, 440, 1298; (Jordan) 51; (Freiberger) 52; (Mathesius) 53; (Andersen) 291; (Müller-Tromp) 907; (Trottier) 1299; for Zn furnaces (Brooks) 1600; (Schumacher) 2376; (Bibb) 3216, 3336.

Brisance (Herlin) 151; see also *Explosives.*

Bristles, art. (Schall) 128.

Brittleness of low-C steel worked at blue heat (Preuss) 434; of rolled wrought Fe as consequence of heating (Baumann) 3209.

Bromal action on polycyclic hydrocarbons (Frankforter) 909.

Bromal hydrate, as cryoscopic and ebullioscopic solvent (Beckmann) 171.

Bromanil, prep. (Kempf) 85.

Bromates, kinetics of bromate-nitrite reaction (Kurtenacker) 744, 2617; ammoniated (Ephraim) 2194; kinetics of bromate-bromide reaction and of formation of, from Br (Skrabal) 2480.

Bromide number, insol., of oils (Sutcliffe) 159.

Bromides, metallic (Guareschi) 417; detection in presence of thiocyanates, cyanides and ferrocyanides (Curtman) 898; of fatty acids (Tsujimoto) 1696; detg. I in presence of (Barnebey) 1728; kinetics of bromate-bromide reaction (Skrabal) 2480; detg. chloride and, together (Meyer) 3043; see also *Halides.*

Bromination, photo-, of toluene (Le Blanc) 294; α-, of ketones (Lapworth) 610; of C_6H_6, C_7H_8 and C_8H_{10} (Ducelliez) 787; of dyes of thioindigo series (Soc. à Bale) P 966; of aromatic amines (Fuchs) 1463; of *o*-nitrotoluene (Gluud) 1616; of aniline (Franzen) 1911; of phenanthrene (Sandqvist) 2543; progressive, of toluene (Cohen) 2895.

Bromine, oxidations with, by light (Claus) 453, 1173; production in 1913 (Phalen) 515; action on B hydrides (Stock) 765; soln. of, in H_2O, CCl_4, and $PhNO_2$ (Joseph) 993; modified Jannasch, app. (Zsivny) 1409; elimination from dibromoanisylideneacetophenone (Wilson) 1769; manuf. (Barstow) P 1977, 1978; estg. phenol by (Versfeld) 2205; action on CO (Piva) 2388; ionization of, solns. of ICl_3 (Plotnikov) 2475; kinetics of formation of bromates from (Skrabal) 2480, action on proteins and amino acids (Siegfried) 2905; action on alkali iodides (Rae) 3182; therapy in epilepsy (Brodsky) 3298.

Bromine, analysis, in presence of Cl and I (Bekk) 2042; in org. compds. (Robertson) 2856; in water (Skinner) 3310.

Bromine compounds, α-bromo derivs. of α,α'-unsatd. ketones (Hellthaler) 56.

Bromine-ion, influence on uricolysis (Jappelli) 2767.
Bromoacetic acid, action of Et ester on β-aminopyridine (Scelba) 616; derivs. (Jacobs) 2077; interaction of alkalies and alkali bromoacetates (Senter) 2764.
ω-Bromoacetophenone, deriv. of oxime (Jacobs) 2077.
Bromoacetylaniline, deriv. (Jacobs) 2072.
Bromoacetylphenylaminoethanol (Jacobs) 2075.
β-[ω-Bromoacetyl]quinaldine and deriv. (Jacobs) 2077.
Bromoacetyl-ω-o-toluidinoacetophenone, and deriv. (Jacobs) 2073.
Bromo-6'-aminoluteolin tetraethyl ether, and derivs. (Perkin) 1312.
Bromo-2-amino-4'-methyldiphenyl ether and chloroplatinate (Cook) 2527.
Bromoanilines, polymorphism of derivs. of (Senier) 202; vanillylidene derivs. of *m*- and *p*- (Senier) 1907; polymorphic anisylidene derivs. of *m*- and *p*- (Senier) 3228.
Bromoanilinium hexabromo-osmiates, *m*-, *o*-, and *p*- (Gutbier) 1439.
Bromoanilinium hexachloroiridates, *m*- and *p*- (Gutbier) 1439.
Bromoanilinium hexachloro-osmiates, *o*-, *m*- and *p*- (Gutbier) 1440.
p-Bromoazophenyl ethyl ether and Ac deriv. (Angeli) 66.
Bromoazoxyphenetole (Valori) 1476.
2-Bromobenzhydrol (Koopal) 2648.
Bromobenzoic acids, NH_4 salts of *o*-, *m*-, and *p*- (McMaster) 2658.
Bromobenzyl chloride, *o*-, and *p*-, 2nd compd. with $(CH_2)_6N_4$ (Jacobs) 1611.
1-Bromobenzyl-2,4-dihydroxynaphthoic acid, Et ester (Nowak) 599.
α-Bromobenzyltriphenylbromomethane, *m*-, 2nd *p*- (Simonis) 1179–80.
o-[α-Bromobenzyl]triphenylcarbinol (Simonis) 1179.
d-α-Bromocamphorsulfonic acids, 2-phenyl-6-methyl-4-pyrone ester (Levy) 63; absorption spectra of NH_4 salt (Purvis) 2184; phenyl-*p*-tolylmethylamine salt (Cohen) 2887.
p-Bromochloroacetylaniline, deriv. (Jacobs) 2073.
Bromochlorocamphorimide (Mannessier) 73.
4-[Bromocinnamal]hydantoin, α- and β- (Johnson) 2655.
Bromocresols (von Walther) 2641; and Bz deriv. (von Walther) 2642.
p-Bromo-m-cresotinic acid, salts (von Walther) 2643.
Bromocyanogen, β-, γ-unsatd. cyclic bases and (v. Braun) 321.
Bromodesoxins (Kotyukev) 3050.
β-Bromodiacetonamine, picrate (Gabriel) 2876.
Bromodibenzoylethane (Marshall) 2224.
Bromodibenzoylphenylmethane (Marshall) 2224.
Bromodibenzoylpropane (Marshall) 2224.
Bromodiethylacetylcarbamide (Bayer & Co.) P 2424.
m-Bromodiethylaniline (Jacobs) 2073.
5-Bromo-4,6-dimethyl-2-pyridone-3-carboxylic acid and Et ester (Simonsen) 2517.
1-Bromo-2,3-dinitrobenzene (Körner) 1479.
Bromodinitro-m-cresols (Gibbs) 615.
4-Bromo-3,5-dinitrotoluene (Körner) 1479.
p-Bromo-p-ethoxybenzene (Angeli) 66.
2-Bromoethoxybenzoic acid, Me ester and amide (Jacobs) 2076.
p-Bromofluorobenzene, nitration of (Hallemann) 2386.
s-Bromofluoroethane (Swarts) 3227.
Bromofumaric acid, benzylamine (Frankland) 604.
α-Bromoheneicosoic acid (LeSueur) 2884.
Bromohydrin, optically active (Abderhalden) 310.
p-Bromo-p-hydroxyazobenzene, and Et ether (Angeli) 66.
Bromo-p-hydroxyazoxybenzene (Angeli) 617.
Bromo-6'-hydroxyluteolin diethyl ether triacetate (Perkin), 1312.
5-Bromo-2-hydroxy-3-methoxybenzaldehyde (Rupp) 2233.
6-Bromo-3-hydroxy-4-toluic acid, salts (von Walther) 2643.
o-Bromoiodobenzene, nitration of (Hallemann) 2386.
α-Bromoisobutyryl bromide, action on benzene (Kizhner) 2066.
Bromoisosuccinic acid, Me ester (Wenzel) 599.
α-Bromoisovalerylisourea, Me ether (Engelmann) P 693.
Bromoluteolin tetraethyl ether and derivs. (Perkin) 1311.
Bromomaleic acid, dibenzylamine (Frankland) 604.
2-Bromo-6-methylchromanone (v. Auwers) 85.
"Bromomethylenequinone" (Pummerer) 317.
Bromomethylheptanone (Wallach) 1458.
2-Bromomethylhydrindene (Kenner) 462.
β-Bromo-β-methyl-α-hydrindone (Kizhner) 2066.
2-Bromo-β-naphthoic acid and derivs. (Wynne) 2893.
2-Bromo-2-naphthylamine and Ac deriv. (Wynne) 2893.
1,4-Bromonaphthylcarbamyl azide (Oliveri-Mandalà) 71.
6-Bromo-2-nitrobenzoic acid (Cluud) 1616.
6-Bromonitro-m-cresols (Gibbs) 615.
Bromonitro-3-hydroxy-p-toluic acids (Gibbs) 615.
Bromo-6'-nitroluteolin ether (Perkin) 1312.
Bromo-2-nitro-4'-methyldiphenyl ether (Cook) 2527.

Bromonitropseudocumenes (Huender) 1762–3.
α-Bromopalmitic acid, action of Ag on (Jones) 1065.
α-Bromopalmityl chloride (Hopwood) 610.
α-Bromopalmitylglycine (Hopwood) 610.
Bromophenanthraquinone and oxime (Sandqvist) 2543.
p-Bromophenoxyethyl bromide and deriv. (Jacobs) 2076.
p - Bromophenylazocarboxylyl naphthylamide (Oliveri-Mandalà) 71.
1 - Bromophenyl - 3 - methyl - 4 - azopyrazole (Michaelis) 1030.
1 - p - Bromophenyl - 4 - α - naphthylsemicarbazide (Oliveri-Mandalà) 71.
γ-Bromopiperidine, salts (Koenigs) 2254–5.
o - [α - Bromopropio] - p -cresyl benzoate (v. Auwers) 808.
γ - Bromopropyl - p - nitrobenzamide (Jacobs) 2075.
Bromosalicylic acid, Pb salt (de Coninck) 2058.
Bromosuccinic acid, action of Mg on esters (Zal'kind) 1748.
Bromotannic sirup (Ridder) 1663.
Bromothioresorcinyldiacetic acid (Finzi) 68.
Bromotriamminoplatinous halides (Chugaev) 3181.
3 - Bromo - 4, 5, 7 - trimethylcoumarin (Jordan) 1605.
3 - Bromo - 4,5,7 - trimethylcoumarin - 6 - 8 - dicarboxylic acid, Et ester (Jordan) 1605.
Bromoyangonin (Borsche) 312, 313.
Bromoyohimbine, -HBr (Barger) 2888.
Bromural, distribution in organism (Gensler) 2945.
Bronze, standard test bars of Zn (Karr) 588; Assyrian (Busch) 589; magnetic measurements on Heusler's Sn-Mn (Take) 1146; specifications 2371; standard specifications for Mn, ingots for sand castings 3201; Al (Corse) 3205; (Jones) 3205; microstructural changes in annealing of (Rawdon) 3205; titan 3205; testing 3206; influence of time of annealing on softening of stretched, wires (Müller) 3208; relation of mechan. properties to microstructure (Rawdon) 3208; color powder (Gubinol) P 3216; powder varnish (Fehringer) P 3369; see also *Copper alloys; Tin alloys*.
Brown-Gibson rule (Fry) 1327.
Brownian movement, demoustration of (Flade) 989; of Lucrèce (Gouy) 1142; detg. Avogadro's const. *N* from (Fletcher) 1413; influence of osmotic compressibility of emulsions on (Constantin) 1710; oils and metal particles in relation to (Zerner) 2030; detg. *Ne* from Brownian movement (Eyring) 2182; of very small metallic particles in gases (Konstantinowsky) 2182.
Brucine, strychnine and (Ciusa) 1479; in nux vomica (Ericson) 1528; micro-reaction of (Scott) 2564.
Brushes, for elec. machines (Becker) P 28; graphitizing (Brown) P 1277; compn. for, for elec. motors (Aylsworth) P 1671.
Bryony (Jensen) 2403.
Bubbles, capillary pressure in gas (Schrödinger) 1869.
Bubonic plague, thermoprecipitin method in diagnosis of (Warner) 1198.
Bucking, textiles dyed with vat dyes (Bohn) P 3366.
Buckley desensitizing paste (Prinz) 3300.
Buds, comp. of, of fruit trees (Manaresi) 94.
Building materials, plastic comp. for (Taylor) P 241; heat cond. of fireproof (Heyn) 519; from peat (Schlisske) P 855; furnace (Baker) P 2582; carbide sludge for (Schumann) 3345; Materials of Construction (Mills, book) 3346; fireproof wall plates (Finger) P 3348.
Bulbs, enzymic activities (McCool) 475.
Bulkheads, block for (Turner Bros.) P 2445.
Bullets. See *Projectiles*.
Bunkers, lining for steel 191.
Bupleuroglycol and oxide (Longinov) 3053.
Burets, protection for, glass cocks (Beger) 257; 419; (Curtis) P 1410; pipet for calibrating (Foulk) 2469; reader (Pratt) 2469; automatic-zero (Mertes) 2725; (Forbing) 2825; weighing (Incze) 3145.
Burgundy mixture (Fonzes-Diacon) 686.
Burners, Bunsen (Strause) P 4; blowpipe (Carbic, Ltd.) P 5; cap for Bunsen (Torossian) 165; polarization and spectrum (Beckmann) 173; for powdered fuel (Peabody) P 709; (Gasglühlicht-Ges.) P 733; blow-pipe for coal gas (Harmer) P 733; for welding or cutting metals (Kongsbak) P 782; Bunsen, as gas injector (Pfotenhauer) 857; unvarying mixt. (Hale) 962; for oils (Hundt) P 964; oil, in foundries (Irinyi) 1111; welding (Standard Welding, etc.) P 1171 (Vogel) P 2010 (Kuntze) P 2505; ceramic tip for incandescent gas (Kluge) P 1242; O-C_2H_2 and O-H (Cooper) P 1410; efficiency of Argand and open flame test (Gilpin) 1682; gas, 1861; compn. of gas and performance of Bunsen (Pierce) 2305; S (Coombs) P 2331; for liquid fuel (Hassler) P 2452; plate grate for (Gerber) P 2586; development of Bunsen (Kistner) 2609; for oil-firing (Essich) 3356.
Burner support, adjustable (Bishop) 2469.
Burning bricks by gas 136; fuel which softens at temps. below 220° (Stewart) P 1386; formation of cryst. hematite during, of bricks (Hughes) 1587; ceramic wares (Schmatolla) 1676; thermo-tech. calcns. for gas chamber furnace for, clay ware (Litinsky) 1678; limestone (Endell) 2444; black flashed brick (Rathfon) 2973; hydrocarbons (Stuart) P 2979; powdered coal (Mann) 3122; see also *Calcination; Firing*.
Burning-mirror experiment, Villette's (Fritz) 1708.

Cadmium, analysis, in Zn (Cooper) 185; Nachweis, Bestimmung und Trennung der chemischen Elemente (Rüdisüle, book) 1159; electrolytic detn. (Hulett) 2613.

Cadmium, metallurgy of, from Zn ore (Rigg) P 1027; requirements in raw material, technic and costs in (Juretzka) 3199.

Cadmium alloys with Bi (Petrenko) 586, 778, 1892; Bi-Cd (Petrenko) 778, 1892; with Au (Saldau) 779; with Zn (Kammerer) P 2869.

Cadmium amide (Bohart) 3182

Cadmium cell. See *Cells, voltaic.*

Cadmium chloride, electrolysis of (Baxter) 735.

Cadmium hexaamine chlorate (Ephraim) 2194.

Cadmium iodide, alc. solns. of (Getman) 2615; compd. with bisdimethylchromone (Simonis) 3251.

Cadmium nitride (Bohart) 3182.

Cadmium-pyridine tetrathionate (Calzolari) 2845.

Cadmium salts, "double complexes" in ionization of (Blomberg) 3153; reactions with KNH_2 in liquid NH_3 (Bohart) 3182.

Cadmium sulfate, soly. of Hg_2SO_4 in, solns., 22; compd. with hexamethylenetetramine (Vanino) 1049; crystal water of $3CdSO_4.8H_2O$ (Blomberg) 1867.

Cadmium tetraamine chlorate (Ephraim) 2194.

Cadogel (Bugarszky) P 2424.

Caffeine and kidney (Vinci) 224; clinical studies (Taylor) 335; and respiration (Edsall) 336; coffee free from (Klein) P 493; volatility in steam (E'We) 513; as cardiovascular stimulant (Newburgh) 1202; estg., and antipyrine in admixt. (Emery) 1972; action on coronary vessels (Sakai) 2110; convulsant action in frogs (Githens) 3297.

Caffeine-sodium salicylate (Liesegang) 1572.

"Caged" ring (Beesley) 610.

Caillet (Meunier) 190.

Cajuput oil (Schimmel & Co.) 2692.

Calabar bean, alkaloids of (Polonovski) 3221.

Calafatite (Calderon) 3194.

Calamine, deposits of, in upper Silesia (Raefler) 3195.

Calamus oil, sesquiterpene in Japanese (Asahina) 1091; (Schimmel & Co.) 2692.

Calcareous substances, structure of, for fat limes (Gallo) 1236.

Calcification, effect of X-radiation on (Cluzet) 663.

Calcination of $MgNH_4PO_4$ (Uecchi) 898 (Pereira) 2492; of dolomite (Tassaro) P 2133; in elec. furnace (Brown) P 2191; of metals (Bloch) 2334; of granular C, etc. (Clymer) P 2612; of cement (Edison) P 2808 (Carnie) P 3347; see also *Burning.*

Calciocancrinite (Borgström) 2365.

Calcite crystn. (Merwin) 42; microchem. reaction of (Thugutt) 576; from chalk (Bowman) 1288; marbles of Vermont (Dale) 1291; from Diosgyör (Franzenau) 3192; see also *Calcium carbonate.*

Calcium, internal therapy (Boruttau) 104; effect of calcareous soils on plants (Glie) 231; in bones and teeth (Morgulis) 478 (Simonini) 1501; balance as control of metabolism (Schoorl) 642; ions and convulsions (Yanushke) 658; supply of farm feeds and animal requirements (Hart) 1073; relation of acidity of *Sphagnum* to chalk (Skene) 1797; condition in milk (Lindet) 2113; and delayed coagulation of blood in jaundice (Lee) 2398; effect on respiratory and cardiac centers (Hooker) 2779; reaction and, content of milk as factors in coagulation process (Milroy) 2903; detg. Mg in presence of (Froboese) 1644; see also *Alkaline earth metals.*

Calcium, analysis (Ledoux) 184; sepg. Mg and Ca salts (Blomberg) 422; Newberry rapid lime detn. (Pierce) 573, 1019; in urine and feces (Lyman) 2770; in soils (Reiche) P 3146.

Calcium acetate, impurities in com. (Bergh) 963; AcOH from (Adler) P 1098.

Calcium acetylsalicylate. See *Acetoxybenzoic acid.*

Calcium alloys amalgams (Cambi) 1880 e. m. f. of amalgams (Cambi) 2182, 2834.

Calcium ammonocalciate (Franklin) 2851.

Calcium bromide and convulsions (Yanushke) 658.

Calcium carbide and extn. of Ra from crude sulfates (Ebler) 174; works at Odda, Norway, 557; decomp. of, and its formation from elements (Briner) 565; manuf. (Thompson) 570 (Becket) P 1584, 3339 (Bosnische, etc.) P 2354; elec. furnace for (Horry) P 1011; recovering waste (Hartenstein) 2741; sludge for building purposes (Schumann) 3345.

Calcium carbonate, system: $CaCO_3$, $MgCO_3$, CO_2 and H_2O (Leather) 181; drying of whiting 530; lublinite (Lang) 576, 2751 (Mügge) 576; protective action of, vs. $MgCO_3$ for *A. chroococcum* (Lipman) 837; deacidification of wines by (Kulisch) 840; and ammonification (Kelley) 946; pptn. of, in sea by bacteria (Drew) 1343; reburning pptd. (Meade) 1670, solubility (Gothe) 2275; solubility product const. (Johnston) 2614; interaction between acid phosphates and carbonates, sulfates and chlorides of Ca and Mg (von Hest) 2964, effects on nitrification (Kelley) 3112; dissocn of, below 500° (Sosman) 3191; see also *Calcite.*

Calcium carbonitride (Peacock) P 1010, 1278.

Calcium chloride compd. with pyrocatechol (Weinland) 319; production in 1913 (Phalen) 515; and growth of corn (Caldwell) 685;

Digitized by Google

compd. with hexamethylenetetramine (Vanino) 1049; refractometric investigations of, serum of milk (Ackermann) 1081; and hemolysis occurring *"in vivo"* (Topley) 1194; as desiccant (Marden) 1264; therapy of, in tuberculosis (Beasly) 2267; dry, prep. (E. Dieterich) P 2428; compds. with glycocoll, etc. (Pfeiffer) 2652; *n* of aq. humor after treatment with (Tristaino) 2905; interaction between acid phosphates and carbonates, sulfates and chlorides of Ca and Mg (von Hest) 2964; elec. resistance of soln. of (Pieri) 3191.

Calcium compounds with higher fatty acids (Haupt) 295 (Zink) 2157; utilization by animal (Fingerling) 1800; with casein (Hoffmann-La Roche) P 1834; with aromatic amines (Ebler) P 2569.

Calcium cyanamide, granulating (Sinclair) P 29; as fertilizer (Schulze) 232 (Cooper) P 3321; mixt. of alkali cyanides with (White) P 359; manuf. (Lidholm) P 686, 687, 3121 (Washburn) 1362, 1719 (Dettifoss Power Co.) P 1434, 2037 (Lidholm Power Co.) P 1722; detg. N in, in presence of nitrates (Segawa) 1085; NH_3 from (Lidholm) P 1100 (Landis) P 2699, 3333; decompn. products of (Kappen) 1818; as raw material for chem. inds. (Carlson) 1831; and germination of barley and wheat (Trnka) 1962; as retarder of denitrification (Lumia) 2120; toxicity (Koelsch) 2351; (Schulze) 2559; storing (Burgess) 2961; see also *Cyanamides*.

Calcium dioxalodiaquochromiate (Werner) 35.

Calcium dioxalodihydroxochromiate (Werner) 37.

Calcium dioxalohydroxoaquochromiate (Werner) 36.

Calcium-glycocoll (Bernardi) 794.

Calcium hydride and extn. of Ra from crude sulfates (Ebler) 174.

Calcium hydroxide, manuf. of hydrated lime in Wash. (Mannell) 139; bisulfite liquor from lime water, etc. (Drewsen) P 237; hydrated lime in dam construction, 240; hydrated lime plant (Meade) 1837; slaked lime (Fleisch) P 2303; manuf. (Toepfer) P 2432 (Meade) 3346; behavior of H_3PO_4 with (Kolthoff) 2743; reaction with S in aq. solns. (Auld) 3183.

Calcium hypochlorite (Griesheim-Elek.) P 2436; dry (Moore) P 3333; see also *Bleaching powder*.

Calcium lactophosphate, prep. of sirup of Fe (Barbano) 1662.

Calcium magnesium carbonate (Schmidt) 2858.

Calcium nitrate (Bosch) P 129; estg. N in Norwegian saltpeter (Busvold) 183; system lime–H_2O– (Bassett) 276; production (Schloesing) P 849 (Birkeland) P 851; reaction between, and K_2HPO_4 in dil. soln. (Withers) 1435; granulating (Berg) P 1671 (Norsk Hydro-Elek., etc.) P 1832 (Holter) P 3121; fertilizer expts. for 1912 (Reitmair) 1818; solubility curve (Taylor) 2019; liquid (Heckenbleikner) P 2296.

Calcium nitride manuf. (Lidholm) P 1377 (Peacock) P 2433.

Calcium oxalate, glycogen in phanerogams — relation to (Politis) 1346; in beers (Will) 2964.

Calcium oxide, system: Al_2O_3–SiO_2–CaO (Rankin) 702; compd. $8CaO.Al_2O_3.2SiO_2$ (Jänecke) 1540; electron emission of a, electrode in vacuum (Germershausen) 2028; see also *Calcium, analysis; Lime*.

Calcium phosphates, di-, fertilizer (Norsk Hydro-, etc.) P 504; $CaHPO_4$ (Stewart) P 1671; detn. of mono-, di-, and tri- and their application (Olson) 1817; detecting impurity in di- (Tagliavini) 2127; formation of $Ca_3(PO_4)_2$ from limestone and $CaHPO_4$ (Brackett) 2280; detg. H_3PO_4 in (Kolthoff) 2746; interaction between acid phosphates and carbonates, sulfates and chlorides of Ca and Mg (von Hest) 2964; osmotic properties of, in relation to those of living cells (Meigs) 3257; see also *Superphosphates*.

Calcium salts of sucrose-phosphoric acid ester (Euler-Chelpin) P 1095; influence upon phlorhizin diabetes (Jacoby) 1801; action on perfused heart (Burridge) 1934; solubility of $SrSO_4$ in solns. of (Raffo) 2176; pharmacol. action (Jones) 2671; theory of decompn. (Kranz) 3294.

Calcium silicates system: Mn_2SiO_4–Ca_2SiO_4 (Kallenberg) 276; tri- (Campbell) 703; S, Se and Te in, glasses (Fenaroli) 1539; calcn. of Ca orthosilicate in norm of igneous rocks (Washington) 1890.

Calcium silicon nitride (Peacock) P 696.

Calcium sulfate, plaster of Paris (Gallo) 134; hydration of, hemihydrate (Rohland) 1540; sulfates of Mg and Na in plaster of Paris (Canals) 2290; pigments of, and ZnS (Carpenter) P 2459; dehydration of $CaSO_4.2H_2O$ (Honda) 2610; interaction between acid phosphates and carbonates, sulfates and chlorides of Ca and Mg (von Hest) 2964; elec. resistance of soln. of (Pieri) 3191.

Calcium sulfides, poly- (Barbieri) 896; photot ropy of inorg. systems (Mourelo) 3037.

Calcium thiosulfate, double decomp. of (Kremann) 747.

Calcium vanadates (Hillebrand) 281.

Calculations, Chem. (Bausor, book) 886, 1020 (Ashley, book) 2856; of furnace additions (Bumgardner) 2635; tables for, in analysis of sugared solns. (Vaccaroni) 2676; Used in Cane-Sugar Factories (Morse, book) 2953.

Calculi, chem. constitution of renal (Kahn) 3094.

Calendering machine for rubber (Gray) P 732.

Calibration of saccharimeters (Sidersky) 975; of buret (Foulk) 2469.

(Della-Groce) 1414; polarization and index of absorption of Röntgen rays from (Kirschbaum) 1715; amorphous (Roth) 1723; reaction with FeO (Falcke) 1883; pptg. action in cyanide solns. (Feldtmann) 1891, 2053 (Ralston) 2368; nutrition of plants (Fischer) 1930; contact action of water vapor and, in oxidation of ferrous compds. (Doroshevskii) 2177; Thomson effect in (Worthing) 2347; vaporization of (Lummer) 2351; Fe, P and (Stead) 2370; (Soc. anon., etc.) P 2433; new proof of asymmetric atom (Fischer) 2521; pure (Plauson) P 2574; calcining granular (Clymer) P 2612; thermoelec. properties (Moore) 2621; decolorization of fuchsin solns. by amorphous (Fortuyn) 2729; construction of diamond with theoretical atoms (Crehore) 2731; hypochlorite-, cell (Thiel) 2738; diffusion of, in Fe (Adams) 2755; modified Fe-C diagram (Sperry) 2755; fixing atm. N during process of graphitizing, shapes (Peacock) P 2973; heats of formation of compds. formed in production of gas from (Hoffmann) 2976; colloidal and gelatinous (Söhngen) 3159; electrolysis of $CuSO_4$ liquors using, anodes (Addicks) 3172; as heating element (Piper) 3174; Fe-C equil. diagram (Ruff) 3209; for elec. purposes (Hennebutte) P 3352; see also *Bone black; Electrode; Graphite; Lighting, electric filaments.*

Carbon, analysis in Fe and its alloys (Szasz) 185; in org. Hg compds. (Abelmann) 279; in aliphatic substances (Grey) 280; in Ce and Ce alloys (Arnold) 572; in steel and W (Johnson) 754; app. for (Lepsoe) 773 (Anon.) 2725; in Fe and its alloys (Adams) 1019.

Carbon alloys, hypereutectic Fe-C alloys (Ruff) 287; tests on pig-iron low in (Geissel) 287; sp. vols. and hardness of Fe- (Levin) 433; Fe-C (Auchy) 778; structure and hysteresis loss in medium-C steel (Langenberg) 1167; (Charpy) 2757; magnetic transformations in (Rumelin) 3209; "near-eutectic" temp. of Fe- (Ruff) 3209.

Carbonates as source of CaO and MgO for plants (MacIntire) 116; decomp. of soil (McIntire) 230; detg. in soil (Hutchinson) 346 (MacIntire) 1084 (Reiche) P 3146; detection of CO_2 in mixt. of, and sulfite (Petersen) 424; mixed (Delgrosso) 576; Cu hydrometallurgy—treatment of, ores (Westby) 1594; detg. Fe in (Barnebey) 1728; detg. CO_2 in (Brubaker) 1730.

Carbon bisulfide. See *Carbon disulfide.*

Carbon chlorides, action of metals on (Zappi) 3001.

Carbon compounds, assimilation by molds (Kossowicz) 641; free energy of (Lewis) 986; with Si for producing NH_3 (Peacock) P 1010.

Carbon dioxide spectrum (Hof) 18; oxans, analogs of (Lidov) 59; action on hemolysis (Lagrange) 102; systems: $MgCO_3$, CO_2, and H_2O and $CaCO_3$, $MgCO_3$, CO_2, and H_2O (Leather) 181; in minerals of scapolite group (Borgström) 189; removal from water (Adams) 229 (Mildner) 1954; production from nerve fiber in atm. of H (Tashiro) 337; manuf. (Naamlooze, etc.) P 361 (Kopp) P 1833 (Nitrogen Ges.) P 1979 (Brownlee) P 2699 (Brownlee) P 3119; removing, from gas (Athion Ges.) P 370 (Soc. l'Air Liquide) P 3339; sepn. from proteins (Lippich) 468; influence on seeds (Kidd) 473; baths (Sarason) P 517, 3330; fusibility curves for systems Me_2O–CO_2 and MeOH–CO_2 (Baumé) 547; sepg., from furnace gases (Basset) P 593; as fertilizer (Quarrie) 684 (Fischer) 2559; sp. heat of (Mercer) 738; output in industrial work (Becker) 816; L'air, l'acide carbonique et l'eau (book) 885; and plant growth (Noyes) 949; purification of fermentation (Nathan-Inst.) P 1223; extinguishing fire by (Aktiebolaget Lux) P 1228; in alveolar air of diabetics (Poulton) 1349; effect of, of stable and of green manure on yields (Bornemann) 1362; antagonistic action on heart (Patterson) 1507; solubility of, in water in presence of starch (Findlay) 1572, ignition points of mixts. of electrolytic gas with—ratio of sp. heats for (Crofts) 1573; carbonation of water (Laubach, etc.) P 1648; diffuson through rubber (Rodt) 1709; action on etherates of alkyl-Mg halides (Chichibabin) 1751; influence of solvent on splitting off of, from dihydroxybenzoic acids (Hemmelmayr) 1761; action on sulfides (Costeanu) 1881; action on tyrosinase (Chodat) 2099; in blood in uricacidemia (Preti) 2107; effect of ethylurethan and chloral hydrate on, production in nerve fiber (Tashiro) 2108; vibration and near its critical temp. (Bradley) 2178; satg liquids with (Pindstofte) P 2333; tests on weathering of marbles and limestones (Merrill) 2368; action on blood pressure (Cathcart) 2779; behavior in pure aq. and saline solns. (Wilke) 2843; tension in alveolar air (Roth) 2916; thermal properties at low temp. (Jenkin) 3006; assimilation by plants (Raikow) 3086, alveolar, detns. and treatment and prognosis of diabetes (Poulton) 3097; b. p. (Kaye) 3161, daily variations of, tension (Erdt) 3280; and eggs of *Ascaris* (Painter) 3303; in air of Bucharest (Minovici) 3313; removing, from air (Cadman) P 3337; see also *Carbonic acid Combustion.*

Carbon dioxide, analysis, app. (Suchier) 257; in flue gas (Heath) P 258; C oxysulfide in (Dede) 424; in mixt. of carbonate and sulfite (Petersen) 424; in minerals and rocks (Borgström) 573; in potable water (Winkler) 1209; in soils (Grigoriev) 1216; in carbonates (Brubaker) 1730; in presence of sulfides (Jones) 1886; in flours and baking powders (Macara) 2272; detg., by loss (Miller) 2470; analyzing gas mixts. contg. (Gautier) 3123; in natural waters (Cavazzi) 3310.

Carbon disulfide, expansion of mixts. of, and acetone (Varona) 994; removal from gas (Evans) 1106 (Teune) 2583.

Carbon filaments. See *Lighting, electric filaments.*

Carbonic acid, dissoc. const. of (Michaelis) 466; formation of, of springs (Pfaff) 585; state of, in blood and mobility of HCO_3' ion (d'Agostino) 3061; mobility of HCO_3' ion at 37° (Quagliariello) 3062.

Carbonitrides (Peacock) P 1010, 1583.

Carbonization of fabrics (Zemann) P 865; in vertical retorts (Fulton) 1240; 1241; progress in, methods (Spencer) 1682; in bulk (Ramsburg) 1683; formation of NH_3 and cyanogen during, of coal (Simmersbach) 2705; effect of temp. and moisture on (Foxwell) 2809; thermal study of, process (Hollings) 2809; of Fe in blast-furnace gases (Byrom) 3201; of Fe or steel (Ford) P 3215; pressure, of moist slime and peat (Ges. f. Industriellen) P 3355; retorts for (Duckham) P 3355; see also *Case-hardening; Cementation; Gas, illuminating and fuel.*

Carbon monoxide spectrum (Hof) 18; elimination of, by animals (Ledent) 224; in mine air (Harger) 241; in flames (Terres) 242; isoelec. point of CO-hemoglobin (Michaelis) 466; poisoning by (Kohn-Abrest) 520; removal from air—estn. in mines (Harger) 1288; (Soc. à Bale) P 1411; reaction with Fe (Falcke) 1883; action on Mg-org. compds. (Egorova) 1904; displacement by O of, from combination with hemoglobin (Nicloux) 1934; removing, from gas mixts. (Badische) P 2299, 2575, 2801; (Jagstfeld) P 2377; action of Br on (Piva) 2388; ds. of coëxisting phases of CH_4 and of (Cardoso) 2474; equil. between COS, S and (Lewis) 2616; effect on life of N-W lamps (Hamburger) 2740; detg. critical const. (Cardoso) 2828, 2474; Fe carbides and their catalytic action on decompn. of (Hilpert) 2847; source of, in air and its detection (Meyer) 3078; utilization by animal organism (Krogh) 3103; capillary consts. for liquid (Crommelin) 3157.

Carbon monoxide, analysis (Graham) 183; KI test for, in blood (Sand) 215; (Froboese) 1287; estn. in mines (Harger) 1288; analyzing gas mixts. contg. (Gautier) 3123.

Carbon oxysulfide, estn. of, in gases (Dede) 424; equil. between CO, S and (Lewis) 2616.

Carbon paper (Butler) P 516.

Carbon steel. See *Steel alloys.*

Carbon tetrachloride (Strosacker) P 354; ternary mixts. of toluene, $C_2H_4Br_2$ and (Rosanoff) 402; mol. wt. of acetone in freezing (Beckmann) 746; soln. of Br in (Joseph) 993; in extn. and estn. of drugs and medicinal plants (Gori) 1827; corrosive action of (Ferguson) P 2795.

Carbon tetraiodide (Lantenois) 953.

"Carbonyl," active, and tanning with org. materials (Powarnin) 977.

Carbonyl compounds, metal sols from their (Ostwald) 1141; with alanine (Gibson) 612.

Carbonyl group, influence on mobility of Cl atoms (Maron) 307; 4,4'-diphenylsemicarbazide as reagent for (Toschi) 2388.

Carborundum, shunt resistances for series incandescent lighting systems (Prietze) 561; from feldspar (Peacock) P 1278; cutout for series W lamps (Lux) 1720; wheels (Carter) P 1836.

1-Carbothioallylaminosemicarbazide (Busch) 62.

***p*-Carboxybenzeneazo-*p'*-diethylaminobenzene** derivs. (Jacobs) 2075.

1-[*o*-Carboxybenzoyl]-3-*p*-tolylcrotonolactone (Borsche) 302.

α-[*o*-Carboxybenzoyl]-β-*p*-tolylpropionic acid, di-Na salt (Borsche) 302.

3-Carboxy-5-carbethoxy-β-4,6-trimethylcoumarinic acid (Jordan) 1604.

***p*-Carboxy-β,β-diphenylpropiophenone** and derivs. (MacClean) 199.

1-[*o*-Carboxyethylbenzoyl]-3-phenylcrotonolactone (Borsche) 303.

1-[*o*-Carboxyethylbenzoyl]-3-*p*-tolylcrotonolactone and benzoate (Borsche) 302.

3-Carboxy-4-hydroxybenzyl chloride compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

3-Carboxy-4-hydroxyphenylarsonic acid and nitro deriv. (Karrer) 2535.

Carboxylase and antiseptic agents (Neuberg) 472; in juice of top yeast (Neuberg) 472; in plants (Zaleski) 814; (Neuberg) 3075; relation to zymase (Neuberg) 3076.

Carboxyl derivative, treating cyanogen compd. of light metal to produce (Bucher) P 2129.

Carboxylic acid. See *Acids.*

Carboxylphenylphosphoric acid, guaiacol ester of Na salt (Engelmann) P 693.

***p*-Carboxymalachite green** (Rassow) 2640.

1-[*o*-Carboxymethylbenzoyl]-3-*p*-tolylcrotonolactone (Borsche) 302.

3-Carboxy-4-nitrophenylarsonic acid (Karrer) 2535.

***p*-Carboxyphenylhydroxytetrazole** (Oliveri-Mandalà) 72.

1-[*o*-Carboxyphenyl]-4-*p*-methoxystyrylfurane-2-carboxylic acid, di-Me ester (Borsche) 303.

1-[*o*-Carboxyphenyl]-4-methylfurane-2-carboxylic acid (Borsche) 303.

1-[*o*-Carboxyphenyl]-4-phenylfurane-2-carboxylic acid, di-Me ester (Borsche) 303.

of methylated (Denham) 203; disposal and utilization of, factory waste (Splittgerber) 376; treating (Vains) 377; detg. degree of bleaching of (Schwalbe) 712; action of alkalies on (Haupt) 712 (Thies) 713; literature (Schwalbe) 713; action of ammoniacal Cu-$(OH)_2$ on (Connerade) 861; rosin in sulfite 964; measuring moisture content (Nordström) 1389; research station for, chem (Schwalbe) 1390; yarns (Süvern) 1390; (Cross) 1393; progress in analysis (Briggs) 1546; hysteresis of degree of hydration of (Rakovskii) 1567; advances in chemistry of (Heuser) 1690, 2588; reactions of silks made from (Matos) 2595; filamentous fungi tested for, -destroying power (Seaks) 2661; defects in sulfite (Oliver) 2709; pptg. for agar (Scales) 2916; elimination of pitch and fat from (Sieber) 3128; action of some oxidizing agents on (Moore) 3365: *Patents:* photographic film from (Reid) 120; dressing material from (Soc. des téléphones) 150; art. threads from (Hartogs) 247; dry distn. of materials contg. (Holzverkohlung-Ind. A.-G.) 376; prepn. (Jardine) 377 (Fornoff) 1247 (Ehrenthal, v.) 3129; plastic compds. and colloidal solns. of (Veimarn) 378; extg., from marine plants (Gloess) 518, 2801; (Loomis) 525; filaments of hydrated (Pellerin) 1114; sulfite (Öman) 1115; and resinous impregnating agent (Günthel) 1232; easily bleached (Jardine) 1246; removing salt deposit on heating surfaces of, digesters (Morterud) 1246; half- (Bergerhoff) 1247; from red beech wood (Braun) 1247; dehydrating (Rice) 1247; drying articles of (Bohumil Jirotka) 1391; imitating fabric surfaces (Manufakturen-G., etc.) 1391; yarn from hydrated (Pellerin) 1396; reclaiming vulcanized scrap rubber contg. (Wheeler) 1556; fermentable sugar from materials contg. (Standard Alc. Co.) 2124; lustrous threads (Joliot) 2311; dissolving (Willstätter) 2311; (Schwalbe) 2312; strainer for (Thoresen) 2588; bleaching (Arledter) 2589; (Jirotka) 2590; products (Bert) 2710; solns. (Willstätter) 2980; protecting, in textile fibers, etc. (Ferrand) 2986; alkali- (Courtaulds) 3130; from red beech (Braun) 3360; recovering acid from, gases (Nebrich) 3360; see also *Hydrocellulose; Paper pulp; Silk, artificial; Sulfite liquor.*

Cellulose acetates (Püschel) P 377; (Knoll & Co.) P 386; (Knoevenagel) 524; (Intern. Cell. etc.) P 862; plastic mixt. of (Lindsay) P 1114, 1546; varnishes and coatings of (Clément) 1253; non-inflammable compn. (Lindsay) P 1282; modifying solubility of (Pauthonier) P 1391; solvent for (Lindsay) P 2311; liquid solns. of (Bayer & Co.) P 2312; preps. as dielectrics (Siemens-, etc.) P 2353; (Ver. für Chem. Ind.) P 2980; solns. (Badische) P 3359.

Cellulose derivatives (Main) 1831; varnishes from (Zapon-Lack-Ges.) P 1850; sol. (Adler) P 3360.

Cellulose desoxins (Kotyukov) 3050.

Cellulose esters, prepg. (Ver. für Chem. Ind. in Mainz) P 377 (Analin Fab.) P 1843 (Bayer & Co.) P 2311; solns. of (Plinatus) P 2589; of fatty acids (Soc. Chim. Usines) P 3358.

Cellulose extracts, cinchonine as reagent on sulfite (Appelius) 251; (Moeller) (Dickerson) 252; (Paessler) 870; distinction and detection in leather (Lauffmann) 2161; detection of sulfite-cellulose in leather (Moeller) 2161; detecting sulfite-, in mixts. (Orthmann) 2324.

Cellulose formate, celluloid-like material from (Bronnert) P 3129.

Cellulose nitrate. See *Nitrocellulose.*

Cellulose xanthates, polymerized (Lilienfeld) P 3359.

Cement for joining portions of moving picture films (Tessler) P 516; for eye-glass mountings (Johnston) P 1227 (Uhlemann) P 1671; coating for Fe (Trigg) P 2132; for filling cracks in buildings, etc. (Edmiston) P 520; linoleum (Micksch) 2819; painting (Macnichol) P 2819; purchase of asphaltic, on bitumen basis (Broadhurst) 2977; for polarimeter tubes (Patterson) 3146; germicidal efficiency of dental (Poetschke) 3289.

Cement, hydraulic, Fe ore (Williams) 138; results with autoclave test (Force) 138; analysis (Baire) 138; Eisenbetonbau (Frank, book) 140; hydrated lime in dam construction 240; dustless packing (Bechstein) 258; raw materials from Naga, Cebu (Reibling) 363 (Pratt) 427; *vs.* brick (Reibling) 364; dust from, mills and setting of fruits (Anderson) 476; coating (Elmenhorst) P 699; hydration of port. (Klein) 701; attacking capacity of waste waters on, sewers (Barth) 1083; vol. changes in port. (White) 1379; detg. time of set of (Williams) 1380; waterproofing (Abraham) P 1382 (Stehm) P 1987; compd. $8CaO.Al_2O_3.2SiO_2$ in port., clinker (Jänecke) 1540; compn. of port., mortars in sea-water (Giorgis) 1679; standardization of, sieves (Wig) 1680; Le costruzioni in cemento armato (Landini, book) 1837; paint for 1848; constitution of Port., clinkers (Endell) (Jänecke) 1984; Die Chemie der hydraulischen Bindemittel (Kühl, Knothe, book) 1987; Calci e cementi: norme pratische ad uso degli ingegneri, architetti, costruttori, capimastri ed assistenti de fabbrica (Mazzocchi, book) 1987; petrographic study of port. (Colony) 2136; chem. similarities (Upton) 2137; durability of, drain tile in alkali soils (Wig) 2444; air analyzer for detg. fineness of port. (Pearson) 2444, 2974; for fissured water-bearing strata (François) P 2581; vessel for liquids (Zürn) P 2581; properties of high magnesia port. (Bates) 2702; Zement und Beton im Tiefbau (Gamann, book) 2975; chem. similarities of (Upton) 3344; life of structures of (Blount) 3345; Schwellung und Schwindung von Zement

und Zement-moerteln in Wasser und Luft (Gary, book) 3346; see also *Mortar; Pussolan.*

Cement, hydraulic, manufacture, burning (Reinbold) 959; production in 1914 (Burchard) 1236; decade's change in output (Eckel) 1236; chemist and (Brown) 1379; cement gun (Weber) 1680; dust in (Schmidt) 1836; (West, book) 1837; operation of mills (Porter) 1985; domestic flint pebbles for grinding 1986; Brit. port., machinery 2137; from sea shells (Fraser) 2444; Fleming dust collecting system (Hanna) 2975; Brit., works 3332; controlling raw mix in (McAnally) 3345; coal dust explosions in, mills (Holly) 3362; *Patents:* plates, tiles from asbestos and (Turner) 136; burning (Ellis) 140 (Lorenz) 855 (Hicke) 1105; from molten blast-furnace slag (Lessing) 140; $MgCl_2$ mixt. for forming "sorel" (Reuter) 140; burning furnace (Anker) 141 (Polysius) 855; (Basset) 141, 365, 960; (Langlois) 141; from feldspar (Brown) 704; (Warren) 704; (Carlson) 1105; (Rhodin) 1106; (Bouvier) 2581; kiln (Crosland) 854; removing cement from furnace (Lorenz) 855; rotary inclined furnace for port. (Akers) 1105; (Moll) 1105; (Rhodin) 1106; briquet for making (Schneider) 1234; comp. for molds for (Schmidt) 1237; (Illemann) 1237; Mg oxychloride (Dietz) 1434; Al silicate in (Leeden) 1541; mixing, with fibrous asbestos (Nesetril) 1680; cooling clinkers in manuf. (Park) 1988; (Amies) 2303; blocks (Molfahols, etc.) 2581; (Mittelrheinische, etc.) 2581; production of (Jungner) 2581; recovering alkalies from stack-gases of, kilns (Newberry) 2703; calcining and clinkering (Edison) 2808 (Carnie) 3347; partially fritted port., ingredients (Ellis) 2808; (Basset) 2975; (Brown) 3347; portland (Goddard) 3348; white (Hannen) 3348; (Master Builders Co.) 3348.

Cement, hydraulic, testing, autoclave (Force) 1380 (Wig) 1984; value of high-pressure steam (Wig) 3344.

Cementation, pitch for luting joints with liquid cement (Lyttleton) P 137; anodes for, of Cu (Hybinette) P 1009; of Fe and Steel (Giolitti, book) 1169; mica (Menzel) P 1980; see also *Carbonisation; Case-hardening; Hardening.*

Cement concrete. See *Concrete.*

Cement kilns. See *Kilns.*

Centrifugal force—in scientific work (Friedenthal) 401.

Centrifugalization, deposit obtained from milk by (Wardlaw) 669; of egg albumen (Rakuzin) 1488; of pepsin solns. (Rakuzin) 1488; clarification of refinery liquors (Hamill) 3375.

Centrifuge, elec. 1557; sewage treatment (Tripp) 2278; (Barnick) 2330; emptying (Eberhardt) 3146. *Patents:* for sugar industry (Mazzacani) 160 (Kopke) 251 (Dibbets) 1702; for clarifying milk (Wright) 493; for sand, etc. (Coleman) 704, 1988; clarifier for treating varnish (Mason) 726, (Holstein) 734; for aerating sewage or other liquids (Irwin) 1083; (Holwill) 1138; (Richardson) 1138; for dehydrating peat, brown coal, etc. (Lambrecht) 1139; for producing coatings (Schmitz) 2332; (Dürkoppwerke) 3147; see also *Separators.*

Cera flci (Ultee) 2899.

Ceramic industry, 1913 (Fenaroli) 852; treatment of waste waters from china-clay works (Kershaw) 1358; war in Europe and (Watts) 1379; heat distribution in ovens (Bigot) 1835; in France 1835; Pb in (Berger) 1982; pottery ind. 2299; patterns for (Welte) P 2444.

Ceramic ware, sound-absorbing (Sabine) 238; warming a continuous kiln, 958; testing clay products (Schuyler) 958; fireclay goods—use in gas works (Holgate) 1539; firing and burning (Schmatolla) 1676; efflorescence and spots of burnt earths 1678; thermo-tech calcns. for gas chamber furnace for burning clay (Litinsky) 1678; construction of dies (Knapp) 1679; drying (Lovejoy) 1679, 2974, 3342; of Am. clay (Bleininger) 2442; legal interpretation of word "vitrified" as applied to (Orton) 2974; (Pukall) 3341; *Patents:* charging device for ceramic materials (Mewes) 138; colored plates (Borner) 136 (Utzschneider & Jaunez) 2579; prepg., for burning (Schwerin) 363; with non-porous surfaces (Theumer) 519; coating, with metal (Heller) 701, 2443; waterproofing (Grünzweig) 701; forming (Berry) 1103; writing tablets of (Steingutfab. Grünstadt) 1234; coating, with Ni (L'aluminium français) 1376; permanent rough surfacing (Utzschneider) 1984; transporting (Hein) 2301; vacuum-jacketed vessels (Evans) 2443; compn. for plates (Philipp) 2443; porcelain with fused-on glass (Skaupy) 2443; (Moses) 2579; (A.-G. Norddeutsche, etc.) 2579; corner pieces of (Kaehler) 2807; flower boxes or pots (Adler-Industriewerk) 2807; plating or decorating, with Al (Moench) 3344; see also *Porcelain; Pottery; Stoneware,* etc.

Cerane (Levene) 1610.

Cerbolite (Porlezza) 1571.

Cereals, feeding, offals 227; prepn. (Mauterer) P 339; food from (Lamb) P 673 (Kitchen) P 829 (Pieser) P 3309; fertilizing value of above-ground parts (Mikulowski-Pomorski) 1086; bleaching and aging (Williams) P 1205; residues from postum (Lindsey) 1355; use of H_2SO_4 in fields of (Hitler) 1653; puffed (Kellogg) P 2407; drying (Löfquist) P 2784.

Cerebrosides, mol. wt. of, from protagon (Pearson) 809.

Cerebrospinal affections, Lange's colloidal-Au test and diagnosis of (Rubensone) 2938.

Cerebrospinal fluid, K in, in disease (Rosenbloom) 98; proteins in (Bigelow) 639; urea content of, with atrophy of infants (Nobé-

court) 1200; in pellagra (Lorenz) 1502; in tetanus (Ferrier) 1505; Au reaction in (Spät) 1506; changes in, after administration of neosalvarsan (Kerl) 1507; effect of pituitary ext. on, secretion (Weed) 1802; in delirium tremens (Steinebach) 1804; action of glandular exts. on secretion of (Frazier) 1933; capillary (Kisch) 2104; test of, in syphilitic involvement of nervous system (Gordon) 2660; colloidal Au test on, in mental diseases (Swalm) 2670; influence of diiodotyrosine and iodothrin on secretion of (Frazier) 2941; staining cells in (Lemchen) 3080; tuberculous (Nobel) 3285.

Cerebrum, expts. on rabbits after removal of (Morita) 1511; decerebration and convulsant action of caffeine in frogs (Githens) 3297.

Ceresin wax (Parry) 234; (Herrnhut) 1256.

Cerium, reciprocal action of, and H (Zhukov) 566; morphotropic relations of Et sulfates of, and other rare elements (Jaeger) 990.

Cerium, analysis, electrolytic sepn. of Th, Zr and (Dennis) P 27; Fe in Ce alloys (Bellucci) 771; C and P in (Arnold) 572.

Cerium alloys, detg. C and P in (Arnold) 572; estn. of Fe in (Bellucci) 771; with Mg (Vogel) 2216.

Cerium compounds (Spencer) 3182.

Cerium oxide, color of (Spencer) 3182.

Cerium sulfate, basic (Spencer) 3182.

"**Cerodecytes**" of insects (Hollande) 1513.

Cerusite (Hunter) 44.

Cesium carbonate, dissociation of $CsHCO_3$ (Caven) 986.

Cesium chloride, ionic hydration and transference nos. of (Washburn) 1265; system: LiCl– (Korreng) 3040.

Cesium chlorolithiate (Korreng) 3040.

Cesium dioxalodiaquochromiate (Werner) 35.

Cesium dioxalohydroxoaquochromiate (Werner) 36.

Cesium 9-molybdic acid arsenate (Rosenheim) 3039.

Cesium trichlorolithiate (Korreng) 3040.

Cetyl iodide deriv. (Jacobs) 2077.

Ceyssatite (Gonnard) 1162.

Chabasite (Vendl) 577.

Chalcocite (Graton) 2208.

Cholecocitization (Emmons) 2047.

Chalcones (Bargellini) 447, 1042; glucosides of (Bargellini) 1317.

Chalcophanite (Ford) 425.

Chalk, calcite from (Bowman) 1288.

Chalk-sulfur epoch, biol. hypothesis on deposition of S during (Bargagli-Petrucci) 3045.

Chamomile flowers (Power) 64; oil (Schimmel & Co.) 2692.

Chamotte, materials prepd. in glass factory [illegible] (Hartwich) 1092.

Charcoal, blood, as purifying agent for As [illegible]) 40; for decolorizing diabetic [illegible] 215; active (Pilaski) P 516; animal (Naamlooze, etc.) P 1100 (Helch) 1527 (Wiechowski) 2797 (Adler) P 2799; furnace for making (Felizat) P 1559; animal, for medical use (Ditmar) 1667; blood (Wischo) 1826; action of animal, on peptic digestion (Divella) 1942; prepg. for stoves (Freund) 1989; adsorption of toxins by animal (Kraus) 2105; filter for waste gases from $(NH_4)_2SO_4$ manuf. (Reinhard) 2143; kiln (Bellamy) P 2308 (Deschamps) P 2451; red, from hop vines (Reinke) 2708; from cotton sticks (McKillop) 2790; decolorizing (Wunsch) P 2801; absorption of air by (Knipp) 2997; adsorption of fuchsin by (Fortuyn) 3014; see also *Boneblack; Carbon*.

Charging blast furnaces (Semmler) P 782 (Johnson) 1163; rotary mixing drums (Stein-u. Ton-Ind.-Ges.) P 1707; shells with fusible explosives (Deut. Sprengstoff-A.-G.) P 1995; diff. grades of liquid fuel (Voigt) P 2146; ore-roasting furnaces (Harris) P 2637.

Charging apparatus. *Patents:* (Mewes) 5; for blast furnace (Zûblin) 53 (Stähler) 782 (Deutsche Maschinenfab.) 1028 (Deut. Masch. A.-G.) 2377; for ceramic masses (Mewes) 138; for furnaces (Anschütz) 982, 1707 (Papouschek) 1263 (Kridlo) 2586; for clay (Maschinenfab. Roscher) 1104; for coke ovens (Kuhn) 1109 (Allen) 1841; for retorts (Arp) 1263; for C_2H_2 generators (Metallwerke Schmitt) 1263; for roasting furnaces (A.-G. für Zinkind., etc.) 1299; (Zetsche) 1708; for gas retorts (Taussig) 1840 (Waddell) 2448 (Köppern) 2449; for vinegar vats (Mayer) 2117; panel for small batteries 2738.

Charring dried kelp (Oppenheim) P 1977.

Chart for detg. tailings value of ores (McCauley) 1450.

Chaulmoogra oil (Chattopadhyay) 3117.

Cheese Roquefort-, fat (Currie) 492; comp. of, from whole milk (Brownlee) 671; lactic acid in lactic fermentation of (Samarani) 671; lactic-acid-forming bacteria in manuf. and ripening of cheddar (Evans) 1079; coloring cochineal (Cornalba) 1354; manuf. from "heated" milk (Benson) 1515; ripening of Neufchatel (Laxa) 1515; bacteria of Liptau (Gratz) 1641; Roquefort and Camembert type (Thom) 1810; bacteriology of, of Emmenthaler type (Eldredge) 1947; Grana (Fascetti) 1947; fat in Swiss Emmenthaler (Koestler) 2115; fat in dry substance of Ital. (Fascetti) 2115; fat in Danish (Jensen) 2116; lactic acid bacteria in (Gratz) 2116; pure cultures in, -making (Gorini) 2116; regulation of fat content of milk for (Wenger) 2116; influence of age of, on fat content (Scheringa) 2271; bacteriol. and chem. expts. on defective (Thöni) 3306; ripening of (Dam) 3306.

Cheese, analysis, moisture and fat in (Barthel) 671; fat in (Nilges) 1079 (Brodrick-Pittard) 1809 (Barthel) 2115 (Teichert) 2116; chlorides

Chloroacetylaniline deriv. (Jacobs) 2072.
Chloroacetyl-ω-anilinoacetophenone and deriv. (Jacobs) 2072.
Chloroacetylanisidines, deriv. (Jacobs) 2074.
Chloroacetyl-ω-o-anisidinoacetophenone and deriv. (Jacobs) 2074.
Chloroacetylbenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.
Chloroacetylbenzylurea, deriv. (Jacobs) 2074.
Chloroacetylbis-[p-dimethylaminophenyl]methylamine and deriv. (Jacobs) 2078.
Chloroacetyl-o-chloroaniline, deriv. (Jacobs) 2073.
Chloroacetyl-ψ-cumidine, deriv. (Jacobs) 2073
2-Chloro-α-acetyl-3,5-dicarbethoxy-β-4,6-trimethylcinnamic acid, Et ester (Jordan) 1604.
Chloroacetyl-p-dimethylaminophenyl-aminoethanol (Jacobs) 2075.
Chloroacetyldiphenylamine, deriv. (Jacobs) 2072.
Chloroacetylethylaminoethanol and derivs. (Jacobs) 2075.
Chloroacetylleucoauramine and deriv. (Jacobs) 2078.
Chloroacetylmethylaniline, deriv. (Jacobs) 2072.
Chloroacetyl-o-methylbenzylamine and compd. with $(CH_2)_6N_4$ (Jacobs) 1612.
Chloroacetylmethylurea, deriv. (Jacobs) 2074.
Chloroacetylnaphthylamine, α- and β-, derivs. (Jacobs) 2073.
Chloroacetylnovocaine and deriv. (Jacobs) 2074.
Chloroacetylphenylaminoethanol and derivs. (Jacobs) 2075.
β-Chloroacetyl-α,α-phenylbenzylhydrazine and deriv. (Jacobs) 2078.
Chloroacetylphenylglycinanilide and deriv (Jacobs) 2072.
Chloroacetyltoluidines and deriv. (Jacobs) 2072, 2073.
Chloroacetyltriphenylmethylamine and deriv. (Jacobs) 2078.
Chloroacetylurea, deriv. (Jacobs) 2074.
Chloroacetylurethan, deriv. (Jacobs) 2074.
Chloroacetyl-m-4-xylidine, deriv. (Jacobs) 2073.
1-[Chloro-p-aldehydobenzyl]-2-hydroxy-3-naphthoic acid, Me ester, and derivs (Lugner) 1464.
4-Chloro-3-aminobenzophenone and Ac deriv. (Maron) 307.
***N*-Chloroaminocamphor** (Forster) 602.
6-Chloro-4-amino-3-cresol (von Walther) 2643.
5-Chloro-2-aminophenyl methyl sulfoxide and sulfone (Zincke) 2649.
Chloro-2-aminoresorcinol dimethyl ether and derivs. (Turner) 2223.
Chloroaniline(s), polymorphism of derivs. of (Senier) 202; vanillylidene deriv. of *p*- (Senier) 1906; polymorphic anisylidene derivs. of (Senier) 3228.
Chloroanilinium hexabromo-osmiates, *m*- and *p*- (Gutbier) 1439.
p-Chloroanilinium hexachlorotridate (Gutbier) 1439.
m-Chloroanilinium hexachloro-osmiate (Gutbier) 1440.
3-Chloro-p-anisidine and Ac deriv. (Hurst) 2888.
Chloroanthracenes (Farbw.) P 2598.
Chlorobenzene, phenol from (Meyer) 627.
Chlorobenzhydrols, 2- and 3- (Koopal) 3648.
Chlorobenzoic acids, NH_4 salts of *o*-, *m*-, and *p*- (McMaster) 2658.
Chlorobenzoylacetic acid, esters of *o*- and *p*-, and derivs. (Thorp) 1619.
2-Chlorobenzoylamino-3-naphthol (Griesheim-Elek.) P 3133.
1-Chlorobenzoylanthraquinone, *o*- and *p*- and diazine (Schaarschmidt) 2255–6.

Chloronitrocresols (Gibbs) 615; and salts (von Walther) 2643.
4 - Chloro - 3 - nitro - 2',4' - dimethylbenzophenone (Maron) 307.
4 - Chloro - 3 - nitrophenylarsonic acid (Boehringer & Soehne) P 1669.
α-Chloro-β'-nitropyridine (Chichibabin) 1902.
Chloropentaacetylcyclohexanepentol (Griffin) 2091.
Chloropentaethoxysilicoethane, action of alkalies and water on (Martin) 2888.
Chloropentamminoplatinic carbonate (Chugaev) 3181.
Chloropentamminoplatinic chloride (Chugaev) 3181.
Chloropentamminoplatinic nitrate (Chugaev) 3181.
Chloropentamminoplatinic sulfate (Chugaev) 3181.
p - Chlorophenacylbenzoylacetic acid, Et ester (Thorp) 1620.
3-Chloro-p-phenetidine and derivs. (Hurst) 2887–8.
p-Chlorophenylacetaldehyde (Späth) 1301.
2 - p - Chlorophenylazo - 1 - naphthol and Me and Et ethers, etc. (Charrier) 793.
1 - [p - Chlorophenyl]1,2 - diethoxyethane (Späth) 1301.
p-Chlorophenylethylene oxide (Späth) 1301.
1 - Chlorophenyl - 3 - methyl - 4 - azopyrazole (Michaelis) 1030.
p-Chlorophenylselenious acid (Morgan) 2889.
p-Chlorophenyl selenocyanate and diselenide (Morgan) 2889.
Chlorophyll, $CHCl_3$ and assimilation (Kōrōsy) 642; photosynthesis (Mameli) 814; (Willstaetter) 908; in maturing of pistachio seeds (Ricciardi) 925; absorption spectrum of (Gulik) 1145; physiol. theory (Iwanowski) 1789; photolysis by (Chodat) 2099; Mg complexes of pyrrole, etc. in their relation to (Chelintzev) 2071; synthesis (Mary) 2644; fluorescence of components of (Wilschke) 2922; action of ultraviolet rays on cells contg. (Stoklasa) 2924; influence of P and Mg on formation of (Mameli) 2925; function of (Ewart) 3084 (Maze) 3085.
Chloropicrin, by action of aqua regia (Datta) 1063.
Chloroplasts, inorg. Fe compds. in (Moore) 474; formation (Ponomarew) 1798.
γ-Chloropropyl bromide, deriv. (Jacobs) 2077.
γ - Chloropropyldiethylcarbinol (Wohlgemuth) 2057.
Chloropropylurethan (Datta) 1064.
2-Chloropyridine, Ac deriv. (Fargher) 2890.
Chlorosalicylic acid, Ba salt (de Coninck) 2058.
o - Chloroselenophenolcarboxylic chloride (Lesser) 80.
Chlorosis, treatment of, in fruit trees (Rivière) 641; Mg in chlorotic plants (Mameli) 3270.
Chloro - p,p' - tetramethyldiaminodibenzyl sulfone (Binz) 2536.
Chlorotoluylanthraquinones (Schaarschmidt) 2256.
Chlorotriamminoplatinous halides (Chugaev) 3181.
δ - Chlorovalerolactonehydrocarbostyril - α, β-spiranes (Leuchs) 84.
δ - Chlorovalerolactone - α - [o - nitrobenzyl]-α-carboxylic acid, Et ester (Leuchs) 84.
ω - Chlorovinyl - 3,4 - methylenedioxybenzene (Borsche) 1773.
Chocolate, roasting, pastes (Neumann) P 110; porous, mass (Dierbach) P 493; estg. cacao shells in (Haeussler) 1078; milk albumin (Kuntze) P 1206; refining (Gäbel) 3310; see also *Cacao; Cocoa*.
Cholera, agglutinins in blood in (Grieg) 1506; toxin (Cicconardi) 1934; transmission of immunity against, to offspring (Hadley) 2399; bacteriol. diagnosis (Schöhl) 2668 (Aronson) 3268; alkalinity of blood in (Rogers) 2940; action of, antitoxin on suprarenal cells (Demetrescu) 3291.
Cholera vibrio, resistance of acid-agglutinated, to bacteriolysis (Lanza) 471; hemolytic action of (Grieg) 934; formation of hematoxin by (Löwy) 1494; vaccination against (Vincent) 1935; see also *Virus*.
α-Cholestanetriol and diacetate (Westphalen) 2536.
Cholestanols, β-, Ac deriv. (Moreschi) 796; double compd. with coprosterol (Windaus) 2246.
Cholestanonediol, acetate (Westphalen) 2536.
Cholestenediol, diacetate (Westphalen) 2536.
Cholesterol, specificity of, with syphilitic serums and of, -reinforced heart antigen in Wassermann reaction (Walker) 98; and phagocytosis (Dewey) 100; in blood and resisting power of red corpuscles in anemic conditions (Antonelli) 222; adrenals and, metabolism (Landau) 222 (Wacker) 650; and Abderhalden reaction (Lindemann) 481; origin of, in lipemia (Beumer) 644; of skin (Weill) 648; degradation in animal organism (Lifschutz) 650; relation to cholic acid (Moreschi) 796; behavior on hydrogenation (Moreschi) 796; subcutaneous absorption and estn. of (Corper) 928; oxidation of, by blood (Lifschütz) 917; metabolism (McKelvie) 933; of brain (Rosenheim) 1193; in giant cell tumors (Weil) 1196; cellular reactions by, in tissues (Stewart) 1198; conversion into coprosterol (Windaus) 1327; genesis of (Dezani) 1338; 1498; in blood during pregnancy (Huffmann) 1505; in tissues under various diets (Lander) 1632; and excretion through the bile (D'Amato) 1800; Hg oleate and (Lami) 1828; of blood serum (Pribram) 1938; of egg fat (Berg) 1946; oxidation of acetate with chromic acid (Windaus) 2246; in organs and blood in hunger (Rothschild) 2397; (Windaus) 2535; α- and β-, acetates

(Westphalen) 2535; action of Bz hydroperoxide on (Westphalen) 2535; double bond in (von Fürth) 2881; assimilation (Mueller) 2926; oxidation (Lamb) 3074; and Wassermann reaction (Carbone) 3096; atheroma (Bailey) 3293.
Cholesterolemia, adrenals in hyper- (Sternberg) 1193; in anemia (Cantieri) 1804.
Cholesterol-sulfuric acid and salts (Mandel) 3059.
Cholesteryl acetate, oxidation of (Windaus) 2246.
Cholesteryl esters, of Egyptian brains (Lapworth) 2548; assimilation (Mueller) 2926.
Cholesteryl oxides, α- and β-, and addition compds. (Westphalen) 2535–6.
Cholic acid, relation to cholesterol (Moreschi) 796; new oxidation product of (Pringsheim) 3234.
Choline, metabolism of (Patta) 477; distribution of injected, in animal body (Euinger) 930; cardiovascular action of (Patta) 1349; conversion into neurine (Schmidt) 2087; in shoots of *Aralia cordata* (Miyake) 2774; physiol. test (Hunt) 3298.
Choline derivatives, physiologically active (Ewins) 295; new (Menge) 296.
Choline ethers, pharmacol. action of (Dale) 104; and derivs. (Ewins) 295.
Choline propyl ether and chloroplatinate (Ewins) 295.
Chondri, in caillite (Meunier) 190.
Chondriosomes, behavior of, of kidney cells in fatty degeneration after P poisoning (Azzi) 2945.
Chondroitin-sulfuric acid (Levene) 811, 1768 (Alsona) 1788; water-sol. salts (Riedel, A.-G.) P 1975.
Chondrosamine (Levene) 2903.
Chondrosaminic acid (Levene) 1768.
Chondrosic acid (Levene) 1768.
"Chromate method" for sepg. alk. earths (Vickery) 2853.
Chromates, reaction of (van Eck) 769; Die Bedeutung der Chromate für die Gesundheit der Arbeiter (Lehmann, book) 1214; compds. of, and dichromates with $Hg(CN)_2$ (Strömholm) 1437; retardation of oxidation of Fe by (Rohland) 1454; effect of theobromine Na salicylate in acute chromate nephritis (O'Hare) 2268; as protective coatings (Rohland) 3134.
Chromatin, origin in bacteria (Ruzicka) 93.
Chrome dye. See *Dyes*.
Chrome tanning. See *Tanning*.
Chrome yellow. See *Lead chromate*.
Chromic acid, oxidation of cholesterol acetate with (Windaus) 2246.
Chroming, continuous, in dyeing (Bemberg A.-G.) P 864.
Chromisalicylic acid and ammoniacal derivs. (Barbieri) 2849.
Chromite, geology of, deposits (Zealley) 1161; Pt in, of Urals (Cerdan) 2750.
Chromium, chrome soap in chrome leathers (Hugonin) 1554; variation with temp. of spectrum of (King) 1577; chromic Fe ores in 1914 (Diller) 2209.
Chromium, analysis, in presence of acacia (E'We) 513; in steel (Rich) 1286; in Fe and steel (Tusker) 1589; (Van Pelt) 2361.
Chromium, metallurgy (Keller) P 907; (Goldschmidt) P 2506.
Chromium alloys, stellite (Haynes) 1892; Cr-Cu-Ni (McFarland) 3205.
Chromium chloride, retardation of oxidation of Fe by $CrCl_3$ (Rohland) 1454; transformation of $CrCl_3$ in aq. soln. (Heydweiller) 1570.
Chromium compounds, structure changes in, at higher temps. (Honda) 173; with W (Kanchev) 1881; of hydroxyanthraquinonesulfonic acids (Badische) P 1998, 2598; chrome-contg. color lakes (Badische) P 2458.
Chromium nitrides (Moldenhauer) 416.
Chromium oxides, magnetic (Sone) 1016; magnetizability of (Wedekind) 1268; heat effect of Cr_2O_3 in fusions with Na peroxide (Mixter) 1437; hydrous Cr_2O_3 (Nagel) 1571, 3183; CrO_3 at high temp. (Honda) 2610; peptization of Cr_2O_3 (Bancroft) 3160; Cr_2O_3 (Gessler) P 3336.
Chromium salts (Badische) P 1536, 2298; in tanning (Marchionneschi) 2607; reactions with KNH_2 in liquid NH_3 (Bohart) 3182; producing, from ores (Boner) P 3335.
Chromium steels. See *Steel*.
Chromi-urea persulfate (Barbieri) 2852.
Chromoform, 953.
Chromogens, oxidation and reduction with plant (Wolff) 3084.
Chromoisomerism. See *Isomerism*.
Chromoleucites, pigments of (Lubimenko) 1929.
Chromyl chloride (Moles) 3184.
Chrono-photometry (Rebière) 2339.
Chrysalis oil, deodorizing and decolorizing (Padoa) P 2822.
Chrysarobin, com. (Jutin) 610 (Eder) 2232; germicidal activity (Schamberg) 936, 2672; characteristic reactions of (Leger) 1972; biochem. properties (Schamberg) 2672.
Chrysophanic acid, characteristic reactions of (Leger) 1972.
Chute, for piling textile fabrics in long lengths to condition them (Palmer) P 259.
Chyliform discharge, pleural (Khouri) 1200 (Patein) 2776.
Chymosin. See *Rennin*.
Cicer arietinum (Sahasrabuddhe) 2261.
Cicutoxin and derivs. (Jacobson) 1330–31.
Cider, concd. (Gore) 2112.

Co.) P 1097; compds. with metals and H_3PO_4 (Watkins) 1971; electrolytic reduction of (Bredenberg) 2243; amines of (Zimmer & Co.) P 2569; catalysis in conversion of, into their toxins (Biddle) 2618; effect of light on org. acid salts (Scoville) 2967.

Cinchona derivatives (Macgilchrist) 662, 937.

Cinchonicine, rotatory power, refractivity and mol. soln. vol. of (Peacock) 749; rate of conversion of cinchonine into—of cinchonidine into (Biddle) 2617–8.

Cinchonidine, rate of conversion of, into cinchotoxine (Biddle) 2618.

Cinchonine, as reagent on sulfite cellulose (Appelius) 251; hydrogenation (Freund) 457; rate of conversion into cinchotoxin (Biddle) 2617; *p*-chloro-*m*-cresotinate (von Walther) 2642.

Cinchotoxine. See *Cinchonicine*.

Cinder, handling, at blast furnaces (Johnson) 905.

Cinematography, colored screens for (Wohl) P 416; cinematographs of electrolysis 1276; films for (Bradshaw) P 1723; color (Campbell) P 2039 (Riper) P 2356.

Cineole, detg. in eucalyptus oils (Harding) 510 (Turner) 1093.

Cinnabar, pigment from (Eibner) P 1696; light and dark (Eibner) P 2319; deposits in Western Nevada (Knopf) 2861.

α - Cinnamal - δ - anisallevulinic acid (Borsche) 2245.

Cinnamaldehyde, reduction (Rona) 58; stability of (Umney) 351; phenylhydrazone and its hydrochlorides, etc. (Wilson) 605; xylylhydrazones, etc. (Padoa) 1318–9; 4,4'-diphenylsemicarbazone (Toschi) 2388.

Cinnamaldehyde 2,4 - dichlorophenylhydrazone (Chattaway) 1037.

Cinnamaldehyde picrate (Reddelien) 1911.

4-Cinnamalhydantoin (Johnson) 2654.

α - Cinnamallevulinic acid and Et ester (Borsche) 2245.

Cinnamic acid, Et cinnamate phosphorate (Willstätter) 309; detection of (Schenk) 1590; α-substituted (Stoermer) 1757; chloroacetylaminoethyl ester (Jacobs) 2075; action of sunlight on (de Jong) 2088; inositol esters (Griffin) 2091; pinityl pentacinnamate (Griffin) 2092.

α-Cinnamic naphthylamide (Albrecht) 912.

Cinnamon, microscopy and adulteration (Pooth) 2269.

Cinnamoylbenzoylbenzylamide (Mumm) 1485.

Cinnamylideneglycerol (Peacock) 2884.

Circulation, abnormal accumulations of serous fluids and (Scheel) 823; action of purine derivs. on (Golowinski) 937; epinephrine and coronary, of monkey (Barbour) 1193; reflex effects of alc. on (Lieb) 1204; effect of functional activity on blood-flow in organs (Barcroft) 2264; action of opium alkaloids on coronary (Macht) 2402; detg., rate in man at rest and at work (Boothby) 3283; disturbance of, caused by "shock poisons" (Mautner) 3285; in picrotoxin convulsions (Pollock) 3287.

Citral, detn. in lemon oil (Böcker) 843.

Citrates, influence on isolated heart (Salant) 1807.

Citric acid, action of Mg salts on, complexes with Al, Fe and Mg (Quartaroli) 32; color reaction for (Häussler) 488; tri-NH_4 salt (Hall) 597; influence of temp. on shaking out of Thomas meal with (Holle) 684; detn. (Kunz) 687; in compressed lees (Kunz) 688; NH_4 salt in detg. P_2O_5 (Quartaroli) 945; lime and lemon as sources of (Dunlop) 1659; ether solubility of (Hill) 1665; tri-Mg citrate and so-called basic Mg citrates (Léger) 2058; stable mixts. of Na perborate with (Chem. Werke Kirchhoff, etc.) P 2577; detecting, in wine (Baier) 2685; complexes of vanadic acid with (Barbieri) 3038.

Citronellal, 4,4'-diphenylsemicarbazone (Toschi) 2388; (Harries) 2878; change into citronellol (Mayer) 3058.

Citronella oil, Java (Spornitz) 78; and climatic conditions (Umney) 844.

Citronellol, change of citronellal into (Mayer) 3058.

Citrous fruits, extg. essential oils and removing peeling from (Giampietro) P 126.

Citrus oils, volatile esters in (Albright) 2966.

Civet, ketone from (Sack) P 2424; (Sack) 2565.

Cladocera, life-cycle of (Smith) 1513.

Clams, osmotic properties of ash (Meigs) 3302.

Clarification, of tannin, etc. (Dammer) P 161; of milk (Wright) P 493; of liquids (Reid) P 1411; effect of Pb tannate, on polarimetric detn. of sugar, dextrin and starch (Grossfeld) 1853; of sugar (Cross) 1854; tank (Redtel) P 2472; of coffee- (Morley) P 2784; influence on compn. of wines (La Marca) 2963; cane juice (Hines) 2991; see also *Sewage; Water, purification of.*

Classifier, ore (Michaelsen) P 780, 1743 (Sutton) P 1455 (Boudwin) P 1743 (Allen) P 2376; for fuel (Liggett) P 1543; for comminuted material (Sutton) P 2332; sp. gr. (Uhlig) P 2333; see also *Separators.*

Clay, action between, filters and salt solns. (Hicks) 38; of N. Dakota (Barcock) 46; pulverizing and sifting (Cammiss) P 136; sifting potters' slip (Teggin) P 137; bricks and refractory white goods with aluminous, bases (Bigot) 238; acid, oil decolorizer 250; absorption of ZnO by, of muffles (Proske) 429; argillaceous sediments (Linck) 775; action of alkali silicates on, suspensions (Rohland) 852; process of waste water purification (Rohland) 944; rational analysis (Kallauner) (Stremme) 958; prepg., for hollow blocks 959; drier for (Stevenson) P 959; plasticity of (Davis) 1020; removing, from phosphate rock (Hoover) P 1087; clearing, slurry (Corundia-G.) P 1104;

Digitized by Google

charging and mixing device for (Maschinenfab. Roscher) P 1104; removing Fe from (Thompson) P 1234; art. poor (Bertram) P 1235; binder for sand-, roads (Moore) 1381; adsorption of dyes by colloidal (Rohland) 1567; for dry pressing 1676; white-burning (Watkins) 1678; washing device 1679; in paint manuf. (Koch) 1696; products from (Pietrusky) 1831; trade from Brit. and Ger. standpoint (Ormandy) 1835; casting slip troubles (Audley) 1835; deposits of Western (Canadian) Provinces (Keele) (Ries) 1835; Clayworkers' Handbook (Searle, book) 1836; deposits near McMurray, Alberta (Ells) 1982; Die Tonofenfabrikation (Müller, book) 1984; colloidal, treatment for trade wastes (Rohland) 2118; Tertiary and pre-Tertiary (Müller) 2135; effect of fineness of sand, on strength of mortar (Roman) 2137; Atterberg plasticity method (Kinnison) 2300; Am. (Bleininger) 2442; deposits of Quebec (Keele) 2442; purifying (Musser) P 2443; sepg. stones from (Müllenbach) P 2472; china (Hickling) 2578; cleaning (Bohn) P 2579; cutting, tubes (Jensen) P 2579; deterioration of fire-, in coke ovens and gas retorts (Holgate) 2584; drying china- (Gee) P 2702; products as engineering materials (Bleininger) 2805; machine for, workers, 2974; colloid in (Ehrenberg) 3159; colloidal in dermatology (Rohland) 3288.

Cleaning, sheet metal (Player) 2054; and plating in same bath (Watts) 3032. *Patents:* Metals (Scott) 193 (Davidson) 592; electrolytic, of metal (Herrmann) 27 (Hotchkiss) 564 (Langbein-P.-Werke) 762 (Couch) 893 (Battle) 3177; metals for enameling (Davidson) 1104; woollen, worsted, cotton (Fincato) 1252; filters (Candy) 1262; cinematograph films (Pierson) 1282; cotton waste (Zimmermann) 1376; garments (Karplus) 2133; hides and skins (Vidal) 3144.

Cleaning apparatus for waste oils (Johnson) P 147; for Sn plates (Reynard) P 1455 (Moore) P 1559; tarnish from metals (Keyt) P 1721; for tubes (Ges.-Rohren-Reinigung) P 3147; for used oil, varnish, etc. (Schön) P 3370.

Cleaning composition for uniforms (Storp) 40; for Ag (Hotchkiss) 397; *Patents:* For porcelain (Welwood) 136; for stone (Bilton) 140; for metals (Feidt) 195; (Wentzel) 359; (Dweak) 516; (Schlabach) 696; for drain pipes (McNabb) 697; for painted and varnished surfaces (Donovan) 726 (Keith) 2459 (Donovan) 2460; (Halman) 1398; (Brown) 1402; for art. dentures (Macrill) 1402; O (Siebold) 1402; for fibers, fabrics (Bertlett) 1549 (Fink) 2817; (Ockelmann) 1553; for glass (Criswell) 2295 (Schroer) 2440; (Krumm) 2299; for washing clothes (Freestone) 2323; (Feldenheimer) 2575; for cinematograph films (Pierson) 2801; (Challis) P 3339.

Cleavage of trichloromethyl-R-carbinols (Kötz) 207; of an α-santolinenone deriv. (Francesconi) 1040; of *dl*-linalol (Paolini) 1323; of decahydroquinoline (Mascarelli) 1475; of colchicine (Windaus) 1481; of fats (Marcusson) 2001; of casein by *Streptococcus lactis* (Barthel) 3269.

Clerodendron heterophyllum L. (Perrot) 937.

Cleve's salts (Chugaev) 3181.

Climatology, physiol. (Osborne) 2398.

Clinker bricks, 238 (Taylor) 701; grinding and discharging from furnace (Woolson) P 258; pulverizing (Granger) P 982; constitution of port. cement (Endell) (Jänecke) 1984 (Rankin) 2137; cooling, in manuf. of cement (Park) P 1988.

Clinkering of coal (Marks) 706 (Hubley) 2704; formation (Parr) 1382; port. cement ingredients (Edison) P 2908; cement (Carnie) P 3347.

Clintonia borealis (Slippy) 692.

Cloaca, rythmic pulsation of, of Holothurians (Crozier) 2947.

Closure, drum (Anderson) P 2332; for casing of tar sepg. bells (Berlin, etc.) P 2449.

Cloth, for troop, uniforms (Seel) 40; testing durability of (Kertesz) P 155 (Berl) 528 (Kertess) 529; coating, with metal (Rafn) P 155; dust-proofing plush (Mendess) P 156; increasing elasticity (Lehmann) P 1550; impermeability of (Wosnessensky) 1694 (Le Roy) 2595; rate of desizing of cotton (Appleyard) 3132; tendering of, during singeing (Thompson) 3132.

Clothing, disinfection (Bordas) 1213; compn. for removing gloss from from worn (Wolfenden) P 1673; cleaning (Karplus) P 2133; detergent for washing (Freestone) P 2323.

Clouding of wines (Weil) 1821.

Clouds, ion, in air (Quincke) 1715; metallic—slag contg. Mn (Lorenz) 2474; metallic (Lorenz) 2490, 3002; (van Nieuwenburg) 3159.

Clove oil (Schimmel & Co.) 2692; direct detn. of volatile, by steam distn. (Hortvet) 3104.

Clover, effect of liming of soil on crop (Morse) 2122; effect of Fe and Al salts on, seedlings (Ruprecht) 2122; effect of inoculation on yield and protein content (Arny) 2559.

Coagulants, pituitary in surgery (Sainton) 825; liquid, for latex (Byrne) P 1260; for water purification (Jacobson) P 1646; coconut water for latex (Leonard) 1858.

Coagulation of albumins by heat (Chick) 90; of As_2S_3 sol by electrolytes (Mukhopadhyaya) 2616; effect of anaphylaxis and leech ext. on, of blood (Lee) 2667; of viscose (Reid) P 149; of rubber latex (Bertrams, Ltd.) P 164 (Boehringer) P 396 (Berry) P 395 (Donaldson) P 980, 1858 (Kaye) (Barritt) 2006 (Ripeau) P 2007 (Wickham) P 2008 (Barritt) P 2163 (Davidson) (Agar) P 2467 (Fulton) P 2824; of blood (Stuber) 212 (Sodikov) 3090; of albumin by pressure (Bridgman) 327; effects produced by, -arresting and,

Digitized by Google

-accelerating substances (Busson) 334; Na citrate and, of milk by rennin (Bosworth) 465; reaction in lues (Hirschfeld) 469 (Dungern) 3261; effect of filtration through Berkefeld filter on coagulability of oxalated plasma (Goddard) 633; of lymph (Howell) 649; by colloid solns. (Ellis) 737; stability of oil emulsion, p. d. at oil-water boundary and, of colloidal suspensions (Powis) 737; of colloidal Au solns. by An, Ag, or Al foil (Veimarn) 742; curdling of milk (Orla-Jensen) 918; physiology of blood (Hirschfeld) 930; inhibition of, by lues sera (Fränkel) 930; of caseinogen solns. (Schryver) 1185; of albumin by electrolytes (Bancroft) 1339, 1788; of albumin sols (Brossa) 1415; in aplastic anemia of C_6H_6 poisoning (Hurwitz) 1503; inhibition by sera (Thaysen) 1790; time of blood (Drinker) 1934; factors of, in primary pernicious anemia (Drinker) 2266; delayed, of blood in obstructive jaundice (Lee) 2398; of caoutchouc (Maatschappij, etc.) P 2608; time of blood—influence of anesthetics (Mendenhall) 2779; reaction and Ca content of milk as factors in, process (Milroy) 2903; catalytic action of alkaloids on (Traube) 3252; test of activity of protective enzymes by removal of proteins by heat (Paquin) 3265; in Sardo sour milk (Fidanza) 3305; see also *Blood; Rubber; Milk.*

Coal, N. Dakota (Barcock) 46; powd. for heating furnaces (Herington) 142; oxidation of S compds. of (Regester) 142; Verflüssigung der Kohle (Lummer, book) 143; dry distn. of (Scott) P 144 (Ludwig) P 522 (Lucas) 706 (Heckert) P 2146 (Tozer) P 2448 (Mellersh-Jackson) P 2811; comp. of (Jones) 241, 3348; coking value of (Bernus) 243; geology of (White) 282; storage of (Anon.) 365 (Kershaw) 365, 706; absorption of O by (Winmill) 365, 1382; tar formation temps. of Am. 368; treating bituminous (Harris) P 371; production of anthracite in 1913 (Parker) 520; fields of Mont. (Stebinger) 581; vegetable matter of Ill., beds (Savage) 584; oxidation of (Porter) 704; microscopic exam. of (Glover) 705; clinkering of (Marks) 706; resources of world (Böker) 706; U. S., available for export trade (Manning) 706; working (Waddell) P 709; hydrocarbons from (Rollason) P 711; S in 856; briquetting (Malcolmson) 1856 (Vitrified Coal Co.) P 859; $C_{10}H_8$ from art. (Mayer) 856; coking (Weeks) P 858; washing (Hunter) P 858 (Kershaw) 1358 (Harris) P 2332; consumption in cement kilns (Dormann) 960; new knowledge of (Porter) 960; fossil (Weithofer) 960; firing South Russian anthracite (Kirsch) 961; simultaneous firing of boilers with, and gas (Barth) 961; firing fine (Dobbelstein) P 962; drying fine (Jahn) P 962; retort for distg. (Hughes) P 962 (Clarke) P 2146; North Saskatchewan River, areas (Dowling) 1021; comp. and quality of (Jeffrey) 1021; from South Central Island, B. C. (MacKenzie) 1021; Willowbunch, area, Saskatchewan (Rose) 1021; production of (Parker) 1106; gas, oil and NH_3 from bituminous (Maclaurin) P 1108; leveling fine, in coke ovens (Gewerkschaft, etc.) P 1109; dehydrating brown (Lambrecht) P 1139; prepg. and sorting comminuted or powdered (Coyle) P 1242; kindling for (Schurrock) P 1244; adding lime dust to (Stadtgemeinde Berlin) P 1244; relations in origin between petroleum and (White) 1291; honeycomb and clinker formation (Parr) 1382; combustion chart for (Cormack) 1383; Ill. (Parr) 1383; spraying (Morin) P 1387; recovering, from furnace residues (Pohl) P 1388; chlorides in (De Waele) 1681; Anthracite, Combination in U. S.; Account of Anthracite Ind. (Jones, book) 1543; resources of Illinois (Kay) (Cady) 1681; decompn. by heat (Porter) 1682; sepg., from slate (Ayres) P 1685; agglomeration of (Steven) P 1686; (Exbrayat) P 3333; fissure (Versfeld) 1734; use in blast furnace (Lange) 1736; fusibility of, ash (Fieldner) 1837; mixing coke ash with wash water from (Mack) P 1841; Moose Mt. District in Southern Alberta (Cairnes) 1890; slack for concrete aggregate (Ketchum) 1985; origin (Jeffrey) 2048; yield of N in (Simmersbach) 2140; fields of Canada (Dowling) 2141, 2447; utilising brown, filter slimes (Maschinenbau, etc.) P 2146; powdered, as fuel for metallurgical furnaces, 2212; drying fine (Baum, A.-G.) P 2449; coking and degasifying fine (Voss) P 2449; prepg., for coking (Koppers) P 2450; dressing fine (Jüngst) P 2473; pulverizing plant (Mathewson) 2582; selecting, 2582; from Somaliland, 2704; clinkering action of bituminous (Hubley) 2704; of Upper Burma (Cotter) 2704; formation of NH_3 and cyanogen during carbonization of (Simmersbach) 2705; economic utilization (Reid) 2808; fusibility of, ash in mixts. of H and water vapor (Fieldner) 2808; "spherosiderite" from, basin (Kubart) 2859; nature of compds. of N in (Terres) 2975; gaseous combustion and economizing of (Bone) 2976; Lab. Work for, Mining Students (Sim, Wylie, book) 2977; burning powdered (Mann) 3122; treating with steam (Burrows) P 3125; see also *Ash; Briquets; Coke; Gas, illuminating and fuel.*

Coal, analysis, microscopic (Thiessen) (White) 283; and sampling (Fieldner) 705 (Gregory) 2703; N in (Fieldner) 705 (Simmersbach) 3348; Cl in (DeWaele) 1541; mine and car samples of (Fieldner) 705; ash in (Weisser) 1238; with phenol as solvent (Parr) 1382; detg. volatile combustible matter (Lathe) 1681; (Stillwell) 2304; field app. for detg. ash in (Lesher) 2976; Kjeldahl digestion (Margosches) 3122.

Coal briquets. See *Briquets, fuel.*

Coal dust, reverberatory firing (Mathewson) 191; tests (Czaplinski) 525; reverberatory furnaces (Bender) 585; for metallurgical

Digitized by Google

ind. (Amberg) 961; limiting, explosions (Kruskopf) P 1118 (Rice) 1393 (Schürmann) P 2314; explosions, 1393 (Morgan) 1547; explosions in cement mills (Holly) 3362; see also *Explosions.*

Coalescence and properties of steel and alloys (Portevin) 1453.

Coal gas. See *Gas, illuminating and fuel.*

Coal mining, Modern Practice (Redmayne, book) 143; explosives in mines 152; new, order 715; Lehrbuch der Bergbaukunde mit besonderer Berücksichtigung des Steinkohlenbergbaues (Heise, Herbst, book) 962; battery-bell signalling system in mines (Wheeler) 2190; in Mexico (Brown) 2141; see also *Explosives.*

Coal tar. See *Tar.*

Coal-tar colors. See *Dyes.*

Coal-tar creosote. See *Creosote.*

Coatings, applying metal surface by spraying (Osborne) 587; of cellulose acetate (Clément) 1253; oxidized, of sheet Fe (Matveev) 1894; inner paraffin, for volumetric app. (Povarnin) 2198; decorating glass with iridescent (Liesegang) 2135; protective (Rohland) 3134; protective, for metals (Allison) (Fish) 3212; Al paint for wooden fermenters (Heuss) 3325. *Patents:* Inside of Zn containers (Waitt) 26; with metal (Schoop) 78, 1278 (Heitmann) 2506; for steel plates for ships' decks, etc. (Porter) 131; lace, etc., with metal (Rafn) 155 (Jenkins) 1672; eggs (Coleman) 227 (Strauss) 2556; Ni (Cooper) 288; Al with Cu or CuO (Carbone) 291; for Cu (Wagner) 292; fusible (Morcom) 360; imitation ice (Weber) 360; cartridges (Lux) 380; metals (Howe) 387 (Hughes) 1743 (Gen. Elec. Co.) 2626 (James) 2638 (Rudge-Whitworth, Ltd.) 2819 (Mannesmannröhren-Werke) 3379; mirror deposits (Declère) 398; metal fabrics of pneumatic tires (Brandenburger) 536; steel with Cu (Page) 591; steel or Fe (Kirby) 592 (Richards) 1171; (Mark) 3214; for wood, cement and metal (Elmenhorst) 699; ceramic ware with metal (Heller) 701, 2443; wood or metal (Graves) 726 (Bullock) 1373; compn. (Eberhard) 726 (Alpe) 3120; (Anilin-Fab.) 730; rubber, on textiles (Higham) 732 (Seiberling) 1395; for roof paper (Binder) 855; for castings (Buddeus) 907; for vacuum-jacketed flasks (Hinkel) 973; metal, on flexible material (Rafn) 1100; agents for preventing rust (Eberhard) 1126, 2459 (Perry) 2601; printing process color (Lauthe) 1127; with glass, metal, etc. (Morf) 1229 (Metallisator) 2133; (Reppin) 1238; for ships' decks, floors, etc. (Holzapfel) 1253 (Denny) 2581; with Au (Max) 1297; Al, glass, etc. with Ni (L'aluminium français) 1376; porous walls (Finkler & Co.) 1398; protective, on Al (d'Amico) 1456; metallic, on fabric (Metallatom) 1550; acid-proof containers (Jordan) 1674; floors (Cowan) 1837; cement, for Fe (Trigg) 2132; Fe or steel with Zn (Skemp) 2218; Fe with Pb (Beneker) 2219, 2220 (Samuel) 2870; for paper (Dunham) 2311; anti-fouling, for ships (Cuneo) 2318; producing (Schmitz) 2332; by elec. arc (Arendt) 2376; with Al (Fritsch) 2378; for Ag, etc. (Lounds) 2432; on Fe, etc. (Townsend) 2432; for mineral-oil containers (Andernach) 2452; wooden articles (Adler) 2460; sheet metal with Al (Fritsch) 2504, 2506; for lining cans for food (Hodgson) 2556; with pyroxylin (Koontz) 2601; protective, for hands (Moore) 2699; for metal cores (Brosch) 2761; plates (Forbeser, etc.) 2800; metal plates with Sn or terne (Taylor) 3217; glass or ceramic ware with Al (Moench) 3344; for rubber (Smith) 3379; see also *Galvanising; Metallisation; Metals; Paints.*

Cobalt, -Ni-pyrite (Vernadskii) 42; phys. properties of (Kalmus) 435; filaments (Tanimura) P 760; electrodeposition of (Jourdain) P 760 (Larson) P 1880; asym. atom (Werner) 764; in 1913 (Hess) 905; chem. and mechanical relations of Fe, C and (Arnold) 1295; electroplating with (Kalmus) 1431 (Buchanan) 2739; complex ions of Ni and, with cyanogen (Rossi) 1438; relation of, Fe and C (Arnold) 1742; colors (Mellor) 1835.

Cobalt, analysis, in presence of Ni (Metzl) 40; (Smoot) 186, in steels (Duffy) 1728; sepg. Ni and Co (Reid) P 2055; (Malatesta) 2200; detection (Atack) 2363; electrolytic detn. and sepn. (Smith) 3040.

Cobalt, metallurgy (Phillips) P 781; from silicates (Burlet) P 1279.

Cobalt alloys, with Fe and Ni (Borchers) P 290; with Ni (Borchers) P 1029; stellite (Haynes) 1892.

Cobalt azide (Wöhler) 1115.

Cobalt chloride, changes of color in solns. of (Kochubei) 2848.

Cobalt compounds, with Ni (Pickering) 2849; Ueber Kobaltmagnesium-Rot (Hedvall, book) 2853.

Cobalt halides, NH_3 compds. of (Biltz) 568.

Cobalt magnesium red, Ueber Kobaltmagnesium-Rot (Hedvall, book) 2853.

Cobalt nitrite compd. with hexamethylenetetramine (Vanino) 1049.

Cobalto - hexamethylenetetramine bromomercuriate (Calzolari) 2846.

Cobalto - hexamethylenetetramine chloromercuriate (Calzolari) 2846.

Cobalto - hexamethylenetetramine iodomercuriate (Calzolari) 2846.

Cobalto - hexamethylenetetramine tetrathionate hydrate (Calzolari) 2845.

Cobalt ores, sampling and assaying (Smoot) 186; Hg from residues (Thornhill) 1740.

Cobalt oxides, reactions between CoO and Al_2O_3 and between SnO_2 and CoO at high temps. (Hedvall) 2844; Ueber die Reaktionen zwischen Kobaltoxydul u. Aluminiumoxyd bei höheren Temperaturen (Hedvall, book) 2852;

Digitized by Google

Ueber die Reaktionen zwischen zinndioxyd und Kobaltoxydul bei höheren Temperaturen (Hedvall, book) 2853; formation of isomorphous mixed crystals between, and MnO and between CoO and NiO (Hedvall) 3039.

Cobalt-pyridine tetrathionate (Calzolari) 2845.

Cobra poison, inactivation of serum by (Hirschfeld) 2939.

Cocaine, detecting (Denigès) 234; new reaction (Pisani) 511; Goeldner's test (Ryan) 2393.

Cocaine hydrochloride, incompatibility of $(BzO)_2Hg$ and (Guyot) 1368.

Cocaine isovalerate (Overlach) P 236.

Cochlearia, mustard oil in (Blanksma) 1613–14.

Cocks, protection for glass (Beger) 257; acid- and alkali-proof (Kessler) P 874.

Cocoa, roasting (Neumann) P 110; (Hall, book) 338; preps. (Balés) P 1952; detection of shells in (Wasicky) 2948; see also *Chocolate; Cacao.*

Cocoline in butter (Gillet) 492.

Coconut, buttons, etc., from, shells (Schwinger) P 129; (Copeland, book) 493; changes in ripening (Sioco) 1189; ind. position of, cake 1205; digestibility and food value of, meal (Lindsey) 1812; coconut water as coagulant for latex (Leonard) 1858.

Coconut oil, ind. position of 1205; adulteration of butter by (Ledent) 2782; compn. (Heiduschka) 2820; (Kregten) 3139; soap made from (J. B.) 3140.

Codeine, polymorphism (Kremann) 909; analysis (Winkler) 1157.

Codeine derivatives, pharmacology of (Pitini) 1076.

Cod liver oil, estn. in emulsions (Buemming) 121 (Zölfl) 845; ferrated (Carlson) 352; confections contg. (Miwa) P 513; nutrient value of (Street) 953; flavorings for (Beringer) 1094; arsenical (Jannsen) 2128.

Cod oil, consts. of fatty acids from sulfonated (Radcliffe) 2460.

Coefficient of Ambard (Obregia) 1938.

Coefficient of expansion. See *Expansion coefficient.*

Coenzymes. See *Enzymes.*

Coffee, treatment (Watt) P 111; preps. (Haidacher) P 112; free from caffeine (Klein) P 493; detection of chicory in (LaWall) 666; injurious substances in (Brauer) 666; removing injurious substances from (Görbing) 666; ext. free from caffeine (Whitaker) P 672; exam. (Sayre) 940; making (Aborn) 1351; "tablets" (Hübner) P 1643; fertilizing 1819; drying (Davidson) P 2275; mixts. (Potter) P 2555; tablets (Leroux) P 2678; —clearing mixt. (Morley) P 2784; compn. of, berry—fertilizing (Anstead) 2789; see also *Caffeine.*

Coffee substitute (Kenney) P 111; (McGill) 226; (Kellogg) P 338, 339, 1205; (Buer) P 944; (Malcolm) P 227.

Cognac, detg. higher alcs. in (Settimj) 2560.

Cohesion, attraction of, of mols. (Mathews) 400; and at. vol. (Ludwik) 983; "cohesion point" of glass (Zschimmer) 1233; status of cohesive tests of bituminous materials (Crandall) 2975; of solids (Chatley) 3000.

Coke, NH_4Cl as by-product of (Strommenger) 143; value of coals for (Bernus) 243; by-product, ind. (Cooper) 243; blast-furnace (Simmersbach) 368 (Koppers) 369; troubles in foundry 590; manuf. (Parker) 1107; boiler firing by (Kenyon) 1241; gas, for steam raising (Nicol) 1241; transport of (Gibson) 1386; (Lewes) 1543; German ind. and war (Frank) 1839; briquets (Behr) 2144, 3351; heating with gas, and metallurgical (Otto) 2144; use in gas producers (Markgraf) 2306, 3350; gas, in central heating plants (Ries) 2306; -handling plant 2584; increasing use of (Volk) 2584; nature of compds. of N in (Terres) 2975. *Patents:* Using steam produced in quenching (Koppers) 144; quenching (Siegwart) 145; (Koppers) 522, 2450; by-products from production (Fischer) 709; cooling (Wärme-Ver.) 859; retort for distg. petroleum to produce (Weiser) 860; (Semmler) 962; -slaking and dumping car (Chasseur) 1109; coking towers (Otto & Co.) 1243; quenching app. (Schöndeling) (Berlin-Anhaltische, etc.) 1243; continuous production (Schwarz) 1387; classifying (Fahrendeller, etc.) 1388; hard (Leadbeater) 1685; mixing, ash with wash water from coal (Mack) 1841; purifying petroleum (Johnson) 1879; dry cooling (Wärme-Verwertungs-G.) 2145; quenching, sifting and transporting (Bremer) 2449; (Fingerland) 3354; see also *Quenching.*

Coke, analysis, ash in (Weisser) 1238 (Eastaugh) 2305; valuation and estn. of (Thaler) 1684; sol. chlorides and total Cl in English (Bridge) 1684; metallic Fe in, samples (Campbell) 1685; N in (Margosches) 1839 (Simmersbach) 3348; Kjeldahl digestion of (Margosches) 3122.

Coke ovens, by-product (Anon.) 143 (Forrest) 1239 (Boardman) 2976; blast furnace gas for heating (Simmersbach) 521; by-product, plant (Anon.) 708 (Lomax) (Boardman) 1839; (Lee) 1240; salt in (Broadhead) 1543; Koppers' (Ramsburg) 1683; (Berthelot) 1685; chem. of operation (Lee) 2144; accidents (Fay) 2447; deterioration of fireclay in (Holgate) 2584; silica brick for by-product (Seaver) 2805; for Am gasworks, 3124; thermal balances (Krueger) 3351; heating, from the top (Simmersbach) 3351. *Patents:* (Koppers) (Lecocq) (Soc. gen. de fours, etc.) 145; recuperator for (Hughes) 243; (Koppers) 708, 1387; closure (Limberg) 859; (Hartung, Kuhn & Co.) 962; leveling fine coal in (Gewerkschaft, etc.) 1109; gas conduit for (Gossler) 1109; charging device for (Kuhn) 1109 (Allen) 1841; gas heating for (Schroeder & Co.) 1109; preventing gas explosions in

Digitized by Google

(Kress) 1243; spreading device for horizontal (Sächsische, etc.) 1388; (Hinselmann) 1544; by-product (Tschudy) 1685; (Simon-Carves, etc.) (Schuster) 1686; heating (Woodall) 1992; vertical (Cochrane) 2144; (Still) 2146, 2448, 3354; gas feed (Gossler) 2449; lining for doors of (Hoss) 2450; (Müller) 2449 (Baroper A.-G.) (Rösch) 2450; heating gas-fired (Doherty) 2706; (Summers) 2811.

Coke-oven gas. See *Gas, illuminating and fuel.*

Coking in Canada (Williams) 707; coal (Weeks) P 858; by-product, ind. and manuf. of Fe (Cooper) 1385; (Summers) P 1992; coal chain stoker 2705; coal at low temps. (Parr) 2705; furnace for, briquets (Gratz) P 2977; Am., practice (Lomax) 3124; centralized plants (Uhlmann) 3124.

Cola. See *Kola.*

Colamine, AcH from (Neuberg) 58.

Colchiceine, action of I and KOH on (Windaus) 1481.

Colchicine, hydrogenated product (Hoffmann) P 1371; cleavage products, etc. (Windaus) 1481; Untersuchungen über Colchicin (Windaus, book) 1919; chloroaurate (Clewer) 2885; action on intestine (Führer) 2945.

Colchicinic acid, action of $KMnO_4$ on (Windaus) 1481.

Colchicum, seeds of (Umney) 3328.

Cold. See *Refrigeration.*

Cold creams (Groat) 1531; greasy (Jones) 2968.

Cold storage. See *Refrigeration.*

Collargol, effects in pyelography (Eisendrath) 486; evaluation of (Warnecke) 1092.

Collector pulp (Joerning) P 2333.

Collidine salts (Weinhagen) 2231.

Collidinium hexabromo-osmiate (Gutbier) 1440.

Collidinium hexachloroiridate (Gutbier) 1439.

Collidinium hexachloro-osmiate (Gutbier) 1440.

Collidinium hexachloroplumbate (Gutbier) 1014.

Collision, ionization by (Harlow) 2028; ionization and radiation of gas mols. due to, with electrons (Nesturch) 2730.

Collodion, diffusion cell (Briggs) 1705; membranes for (Elder) 3079; membranes for ultrafiltration and pressure dialysis (Walpole) 3253.

Colloidal chemistry, centrifugal force in (Friedenthal) 401; of indicators (Hantzsch) 406; of celluloid (Schwarz) 524; of tannin (Navassart) 741; Einführung in die Kolloidchemie (Pöschl, book) 1004; Grundzüge der Dispersoid-chemie (Veimarn, book) 1004; and photography (Lüppo-Cramer) 1013, 3178, 3179, 3180; of asphalt (Rosinger) 1112; (Vanzetti) 1141; and Some Tech. Applications (Taylor, book) 1147; in soil science (Gedroits) 1215; progress (Kindscher) 1264; process for removing microörganisms from water (Strell) 3313.

Colloidal metals. See *Metals.*

Colloidal solutions, reversible transformation of emulsoids into suspensoids (Scarpa) 7; dispersion and pptn. of Cu sulfides from (Tolman) 44; of Ag or Fe (Crookes) P 129; of radioactive substances (Paneth) 174; of Au, Ag, etc. (Schwerin) P 237; of cellulose (Veimarn) P 378; of Na urate (Bechhold) 465; of S and Se in glycerol and erythritol (Veimarn) 546; stability of oil emulsion and p. d. at oil-water boundary and coagulation of (Powis) 737; coagulation by means of (Ellis) 737; Ueber die Bedeutung des Lichts für die Bildung und Stabilität Kolloider Lösungen (Nordenson, book) 886; intravenous use of, in shock (Hogan) 1203; ultramicroscopy and (Bachmann) 1416; in dark field (Pooth) 1868; decolorization of, of As sulfide (Peskov) 2170; formation (Donau) 2170; elec. cond. of (Nordenson) 2170; relation between Tyndall effect and size of particles of (Mecklenburg) 2831; variation of catalytic power of saline and, with conc. (Giurgea) 3015; osmotic pressure of (Cohen) 3159; van Hatschek's theory concerning viscosity of (Rossem) 3159; Introduction à la connaissance des solutions colloidales (Rebière, book) 3168; in $CHCl_3$ (Freundlich) 3259; see also *Brownian movement; Gels; Hydrosols.*

Colloids, protective action of (Groh) 7; filtering (Kreszewski) P 133; effect on viscosity of binary mixts. of nonelectrolytes (Scarpa) 170; compd. of strychnine (McGuigan) 225; humus acids in Japan (Tadokoro) 231; removal of ions from adsorptions in (Schwerin) P 237; medicaments (Paul) 353; in Ind. Arts (Arndt, book) 357; lecture (Svedberg) 406; liquid crystals and (Lehmann) 464; plant (Samec) 468; Ag (Korndoerfer) 508; elec. charge and limiting values for (Kruyt) 543; in pyridine (Pieroni) 741; heat of swelling of (Rosenbohm) 742; dichromated colloid photographic process (Sury) P 764; properties of terra rossa (Rohland) 775; soil (Fraps) 345 (Cameron) 832; elec. synthesis of (Mukhopâdhyâya) 875; electrolysis of $SbCl_3$ in presence of (Mazzucchelli) 1008; soil, and sugar beet culture (Rohland) 1084; in soap ind. (Welter) 1128; mastic solns. (Bender) 1142; arsenates (Klemp) 1142 (Deiss) 1416; detg. in soil (Gedroits) 1215; $Os(OH)_4$ and $Ru(OH)_4$ (Kalle & Co.) P 1378; coagulation and peptization of albumin sols by (Brossa) 1415; MnO_2 (Witzemann) 1567; acid soils of Japan (Takodoro) 1815; behavior toward liquids (Caspari) 1868; catalytic action of, metals of Pt group (Paal) 1883; mercuri-organic compds. (Raffo) 2022; changes in starch (Samec) 2097; absorption of lipo-, in plasma membrane (Czapek) 2102; alkaloids (Traube) 2108; of humus (Fischer)

2119; (Mazzoli) 2169; soil, and their adsorption power (Rohland) 2279; light and (Stintzing) 2340; stabilities in polluted waters carrying (Lederer) 2785; optical properties of colloidal silicic acids (Rinne) 2857; stalagmometric studies of solns. of—diffusion in surface layer (Berceller) 2902; action of penetrating Ra rays on inorg. and bio- (Fernau) 2909; phys. condition of (Oryng) (Pauli) 2909; whipping chemicals into, and purification of H_2O (Black) 2955; Die Bodenkolloide (Ehrenberg, book) 2963; formation of, of metals (Nordenson) 3002, 3003; growths deposited from solns. of inorg. (Moore) 3069; non-protein, colloidal, nitrogenous substance in milk (Kahn) 3071; non-toxicity of inorg. colloid solns. on protozoa (Morse) 3102; filter for (Kruszewski) P 3147; of metals and hydroxides of Pt group (Amberger) 3159; of gelatinous C (Söhngen) 3159; chem. reactions in (Jacobsen) 3159; catalysts (Verkade) 3159; in clay (Ehrenberg) 3159; in physiology (Sleeswijk) 3254; significance of viscosity measurements in study of org. (Schibig) 3258; colloidal clay, kaolin and talc in dermatology (Rohland) 3288; swelling of body (Dunn) 3290; colloidal properties of mineral waters of Roumania (Giurgea) 3312; disturbing influence of, in hardness detns. according to Clark (Ruijs) 3312; colloidal properties of concrete (Rohland) 3344; see also *Gold; Silver*, etc.

Colon, oil-ether colonic anesthesia (Baskerville) 2769.

Colophony, solidity (Hauser) 2022; (Aktschourin) P 2320.

Color(s), matching (Wearham) P 5; color rendering of photographic gelatin plates (Stenger) 31; and constitution of azo compds. (Hewitt) 204; filter for elec. lamps (Brady) P 269; "color-degree of dispersion law" (Voigt) 406; of illuminants (Jones) 407; color valuation of tanning materials (Kerr) 534; of metals (Martiochek) 777; gelatin, for printing forms (Charles) P 850; imitation of, of Egyptian cotton 863; produced by some nitro compds. (Harper) 1037; of certain amines (Kehrmann) 1051; detn. of wort, beer, caramel- and black-malt infusions (Schnegg) 1222; and structure (Ismail'skii) 1471; and constitution (Baly) 1577; in orcinolphthaleins and derivs. (Orndorff) 1616; of some cyclic ketonic acids and their esters (Stobbe) 1772; Ni and Co (Mellor) 1835; estn. of high temps. by (Paterson) 1869; of plant pigments (Horowitz) 1930; of firebricks 1982; observing, in liquids (Frisch) P 2011; of mixts. of anilines with aromatic nitro compds. (Biron) 2069; (Orlov) 2069; development of under-glaze- (Jacobs) 2135; inheritance of, in melandrium (Shull) 2395; dark, in canned corn (Bigelow) 2405; effects in gases at low pressures (Knipp) 2477; estn. of high temps. by (Paterson) 2480; standards (Arny) 2492; for glass, porcelain, etc. (Eichler) P 2579; changes of, in solns. of $CoCl_2$ (Kochubei) 2848; -atlas (Ostwald) 2983; of CeO_2 (Spencer) 3182; numerical and graphic representation of, of solids (Bloch) 3350; see also *Color reactions; Dyes; Pigments*.

"Color-degree of dispersion law" (Voigt) 406.

Colored compounds, new class of colored reduction products of 1-benzoylanthraquinones (Schaarschmidt) 2256.

Colorimeter, color detn. of wort, beer, caramel- and black-malt infusions by (Schnegg) 1222; for phenolsulfonephthalein test for kidney function (Brotherhood) 2393; converting Dubosq, into nephelometer (Bloor) 2725; dextrose (Sheaff) 3266; use with formol titrations (Adler) 3322.

Colorimetry, methods of analysis (Autenrieth) 213.

Coloring of salts by Becquerel rays, etc. (St. Meyer) 411; metal (Blassett) 589 (Grochuff) 3151; Al (Schumacher) 701; Metallocromia: colorazione e decorazione dei metalli per via chimica ed elettrica (Ghersi, book) 1169; wood (Brooks) P 1237 (Petersen-Hviid) P 1681; cochineal cheese (Cornalba) 1354; of picrylmethylamine derivs. by alkalies (Franchimont) 1768; of $(NH_4)_2SO_4$ (Bianchetti) 2583.

Coloring matter of *Rhamnus catharticus* (Oesch) 205; in *Diasona violacea* (Holt) 337; of meats (Hoagland) 827; use of harmful, in food, etc. (Sudendorf) 395; of the rose (Willstätter) 1302; of scarlet pelargonn and larkspur (Willstätter) 1304; of the whortleberry (Willstätter) 1303, 1305, 1306; of grape (Willstätter) 1305; of *Althaea rosea* (Willstätter) 1306; of wild mallow and peony (Willstätter) 1307; variations in, of flowers (Willstätter) 1308; of tree moss (Edge) 1693; nomenclature of, of malt (Lintner) 2284; of org. world (Foster) 2151; in foodstuffs 2948; report on, in 1912 (Mathewson) 3105; see also *Color(s); Dyes; Pigments*.

Color photography. See *Photography, color*.

Color reactions, for citric acid (Häussler) 488; of compds. of residual affinity (Harper) 610, 612; for occult blood (Couturier) 1187; for oils of sea animals (Tortelli) 1255; of albuminoid substances (Ganassini) 1339; for differentiating human and cow milk (Eustis) 1353; of gelatin (Liesegang) 1828; of gallic acid and tannic acid (Mörner) 1924; in blood corpuscles (Rubino) 2393; aldehyde—detecting art. invert sugar (Schenk) 2553; of histidine (Pauly) 2918; papaverine (Warren) 2967; spectroscopic exam. of, of indole derivs. and of urine of dogs after their administration (Homer) 3074; of trioses and methylglyoxal (Neuberg) 3080; for atropine hyocyamine and scopolamine (Wasicky) 3190.

Colostrum, ash of (Sato) 669.
Columbium, at. wt. (Smith) 2357.
Columbium, analysis, in presence of Ta (Levy) 1884.
Coma, in art. respiration (Almeida) 652; CO_2 in alveolar air of diabetics and onset of (Poulton) 1349; diabetic (Rosenbloom) 2107.
Combination. See *Chemical combination.*
Combustibles, protecting, from fire in tanks (Scheuffgen) P 244; in sewers (Sprague) 343; review of investigations (Meneghini) 365; detg., in air (Beckmann) 715; receptacles for inflammable liquids (Costantini) P 1138 (Masoni) P 1410 (Hoffmann) (App. Ges.) P 2999; storing and drawing off (Ind. Architektur- etc.) P 1139; ignition of mixts. of vapors and air (Hofsäss) 1384; Verfahren zur Prüfung der Luft auf Gehalt an brennbaren Stoffen (Beckmann, book) 1887; sepg. (Kraus) P 2333; see also *Fuels.*
Combustion, in inner cone of Bunsen flame (Ubbelohde) 366; complete, of rich gases (Heyl) P 371; of NH_3, HCN and C_2N_2 to NO (Wehrheim) 417; of pure C on grate (Richards) 520; heating by "surface" (Kirke) P 709; flameless (Hansen) 855 (Ellis) 961; fractional, of gases over CuO (Terres) 1239; effect of pressure on, of explosive mixts. of gas and air (Terres) 1248; chart for coal and oil (Cormack) 1383; processes in organism (Höber) 1495; flameless, of gases (Schmidt) P 1841; boat 1861; org. (Reimer) 2041; (Brach) P 2168; burning gas with air in partial vacuum (Rector) P 2307; gaseous, at high pressure (Bone) 2582; regulating gas-, in furnaces (Doherty) P 2706; tubes (Malm) P 2806; relation of O tension of atm. to (Dallwig) 2828; gaseous, and economizing of coal (Bone) 2976; Furnace Efficiency, and Flue Gases (Peebles, book) 2977; Steam Boilers and (Batey, book) 3351; see also *Heat of combustion.*
Complement, 3rd component of (Thorsch) 933; in milk (Hewlet) 1197, 2399; Berkefeld filtration of (Schmidt) 1198; inactivating of (Schmidt) 1198; destruction of, and presence of O (Jacoby) 1506; influence of shaking, ultraviolet rays, and Röntgen rays (Scaffidi) 1805; -producing substance in cow milk (Hewlett) 2668.
Complement-deviation test, with tuberculin (Bronfenbrenner) 333; hemolysins and hemagglutinins as indicators in (Pfeiler) 1804.
Complement fixation, with Besredka's antigen (Bronfenbrenner) 223; complement fixing substances in sera in Wasserman reaction (Fürst) 823; temp. and sp. (Müller) 823; tumor immunity (Morgenroth) 934; reaction (Gózony) 1197; reaction in syphilis (Harris) 1199; blood corpuscles in, reaction (Pfeiler) 1924; in pertussis (Olmstead) 2399; in chicken sarcoma (Balley) 2938.
Complex compounds. See *Chemical compounds.*
Complex salts. See *Salts.*
Composition. *Patents:* For laying road dust (Ellis) 241; for molded articles (Fairfax) 516; preventing condensed moisture on glass, etc. (Pickering) 695; for making tight joints of boxes (Stavanger, etc.) 851; for removing gloss from worn garments (Wolfenden) 1673; for inner tubes of pneumatic tires (Clare) 1704; puncture-sealing (Cruse) 1859; heat-producing, for clearing sewer pipes (McNabb) 2279; for closing punctures in pneumatic tires (Van Valkenburg) 2327; for restoring worn moving-picture films (Hochstetter) 2698; for dental models (Nielsen) 2800; for preventing fouling of window glass (Schroer) 2803; for destroying soot (Watt) 3125.
Composition, plastic, from casein (Halen) 163; production of (Halen) 163, 695; recovery of solvents used in mfg. (Barthélemy) 245; albuminous substances in (Steinitzer) 1590; (Main) 1831; *Patents:* (Dodd) 132; for coating roofing felt (Halle) 140; (Goldsmith) 163; (Chanard) 164; for flooring, etc. (Taylor) 241 (Rössler) 704; treating preformed articles (Rice) 256; magnesite (Fraser) 360; (Blücher) 361; solid elastic masses (Meusel) 362; (Beatty) 377; conversion of cellulose into (Veimarn) 378; for dress forms, etc. (Sanderson) 696; from acetylcellulose (Lindsay) 1114; for molded articles (Goldsmith) 1374; (Caudemberg) 1374; (Stockhausen) 1375; for insulation (Regal) 1377; (Stockhausen) 1408 (Wiechmann) 1535; (Elder) 1673 (Stockhausen) 2008; (Aylsworth) 2132; (Stockhausen) 2163; from soy bean (Dodd) 2296; for making cores of obturators of breech-loading ordnance (Gerdom) 2296; (Labbé) 2297; (Dalley) (Peter) 2433; (Plinatus) 2573; from peat and wood (Gasser) 2576; (Campbell) 2700; for waterproofing walls, etc. (Horn) 2715; fire-proof, water-proof and acid-proof (Siegmann) 3339; for tarring roads (Rosen) 3347; see also *Rubber, artificial and substitutes; Caoutchouc, artificial and substitutes.*

1951; Ueber Bouillonwürfel, Speisewürzen und Fleischextrakt (Micko, book) 2953; see also *Food*.

Condition diagram, of system BzOH–C_5H_5N (Baskov) 2173.

Condition equation, calcn. of heat of vaporization by Berthelot (Partington) 11; contradictions (Laar) 173; of gases and quantum theory (Sackur) 399; (Wagner) 741; relation between Joule-Thomson effect, sp. heat and (Plank) 880; of air and A (Holborn) 3149.

Conditioning, grain (Norton) P 2117.

Conduction, electric, in metals (Hall) 13 (Northrup) 2347 (Thomson) 1877, 2482, 3019; in flames (Thieme) 998, 2347; electron theory of, in metals (Minton) (Livens) 881 (Livens) 1576, 2482, 2733 (Richardson) 2733; in recovery of resistance of Se following illumination (Brown) 2027.

Conductivity, electric, of salt vapors (Kalandyk) 11; in anisotropic liquids (Svedberg) 11; lubricant of high (Pommerhanz) P 28; of air in contact with P (Schenck) 172; of dil. acid and alkali solns. (Paine) 262; of liquid alloys (Bornemann) 409; of Na amalgams (Vanstone) 409; in tissue (Osterhout) 466; photo- (Volmer) 549; of acids in alc. (Goldschmidt) 745; of Zn and Ag alloys (Petrenko) 777; effect of pressure on, of Al-Ag alloys (Beckman) 779; of liquid insulators (Holde) 879, 1389; electromagnetic waves in perfectly conducting tube (Silberstein) 881; of tetrazole and derivs. (Oliveri-Mandalà) 884; of electrolytes in org. solvents (Pearce) 992; of NaI-KI in mixts. of EtOH and H_2O (Wightman) 993; of metals (Mahlke) 997 (Thomson) 2181; of metallic films (Riede) 997; influence on, of heavy hydrocarbon oils of presence of soaps of naphthenic acids and of phenols (Holde) 1109; relation of heat to (A. B.) 1141; measuring, of vapors above 1500° (Northrup) 1144; detg. very weak acids and bases by, measurements (Horiba) 1265; of pure liquids (Carvallo) 1268; of solns. of electrolytes (Jones) 1269; and reaction between $Ca(NO_3)_2$ and K_2HPO_4 in dil. soln. (Withers) 1435; photochem. (Volmer) 1709; influence of some glycols on, of boric acid (Böeseken) 1766; of certain electrolytes in abs. EtOH (Robertson) 2018; of Pd during occlusion of H (Beckmann) 2026; pressure and, of pure metals (Beckmann) 2026; pressure and, of Te (Beckmann) 2026; of strong solns. (Tucker) 2026; elec. strength of air (Whitehead) 2035; of colloidal solns. (Nordenson) 2170; of system BzOH–C_5H_5N (Baskov) 2173; in mixed solvents (Doroshevskii) 2173; of rarer metals and alloys (Barratt) 2345; of mixts. of fused salts (Sandonnini) 2834; in solvents with dielec. consts. up to 13—from 13 to 80 (Sakhanov) 3009; of mixts. of solid salts (Sandonnini) 3009; measurements of, of solns. (Taylor) 3019; mol., of iodoanilinesulfonic acids (Boyle) 3155; relation between a. c. cond. of a dielec. and its change of capacity with frequency (Bairsto) 3174; effect of H_3BO_3 on, of methylated mannitols (Irvine) 3229.

Conductivity, thermal, of fireproof building materials (Heyn) 519; detn. of, of gases (Heindlhofer) 879; of incandescent W, Ta and C (Worthing) 891; of refractory materials (Dudley) 892 (Goerens) 1234 (Dougill) 1982; of Hg at low temps. (Onnes) 1580; heat transmission capacity of silica dish (Lewis) 1869; of rarer metals and alloys—of poor conductors (Barratt) 2345; of Hg (Nettleton) 2345; change in, of metals on fusion (Porter) 2345; change in, of Se crystal with change in illumination (Sieg) 2732; of metals (Jordan) 2997; of thermal insulators (Jakob) 3149; of dissociated gases (Isnardi) 3161; correction for error introduced by container in detns. of, of liquids (Vallot) 3162; see also *Heat*.

Conductors, electric (Allen) P 269; resistance in, in magnetic field (Onnes) 735; (Achenbach) P, 1280; substitutes for Cu (Garlepp) 2571; skin effect in (Kennelly) 2624; Al cables (Driver) 2740; see also *Lighting, electric filaments*.

Conduits, blast, for furnaces (Zillgen) P 783; Pb-dissolving power of water in drinking water, of Enschede (Rodenberg) 3312.

Conessine (Burn) 659.

Confectionery, marshmallows (McGill) 227; detg. glycerol in (Forman) 512; medicinal (Miwa) P 513; Traité général de confiserie moderne desserts, glaces, chocolats (Duval, book) 1205; Aliments sucrés, sucres, miels, sirops, confitures, sucreries, sucs de réglisse (Roux, Muttelet, book) 1258; (Shaw) P 2116.

Configuration, of diphenylsuccinic acids (Wren) 2223; influence of, on condensation reactions of polyhydroxy compds. (Irvine) 3229.

Congo acids, blue and red (Hantzsch) 1175.

Coniferae, variation in length of fibers (Shepard) 713; resistance to injection with creosote (Teesdale) 2138.

Connective tissue. See *Tissue*.

Connellite (Ford) 1888.

Conserves, tomato (Guarneri) 1078; Les Conserves des tomatoes (Carles, book) 2953.

Consistence curves of mineral soils (Johansson) 230.

Constantan, resistance of, at low temps. (Onnes) 880.

Constants, wave lengths of H lines and detn. of series (Curtis) 18; influence of hydroxy acids and lactones on detns. of chem., of fatty acids (Browne) 389; absorption, reflection and dispersion, of quartz (Coblentz) 409; detg., of Ra D (Thalier) 411; ore pulp (Clevenger) 430; for wt., vol. and heating values of gases for use in thermotechnical calcns. (Hoffmann) 521; intern., for Ca

558; elec., of antennas (Cohen) 562; animal cell (Mayer) 648; lipemic (Terroine) 648; Annual Tables of (book) 885; Tables annuelles de constantes et données numerique, de chimie, de physique et de technologie (book) 1147; "cohesion point" of glass (Zschimmer) 1233; physico-chem., of juices of *Passiflora gracilis* (Harris) 1930; phys., of gas oils and derived tars (Rittman) 1991; affinity, and catalytic activity of an acid (Taylor) 2018; entropy, of gases and liquids (Tetrode) 2020; ionization, of indicators (Paulus) 2016; Despretz-Trouton (Berthelot) 2180; phys. and chem., of mineral waters (Bordas) 2276; of petroleum distillates (Rittman) 2308; detg. new, for beeswaxes (Salamon) 2322; electronic and at. (Allen) 2337; of fatty acids from sulfonated cod oil (Radcliffe) 2460; of milk (Ledent) 2554; solubility product, of Ca and Mg carbonates (Johnston) 2614; for double polarization method of sugar analysis (Pellet) 3374; see also *Capillary constants; Dielectric constants; Dissociation constants.*

Constipation, constipating constituents of opium (Takahashi) 486.

Constitution. See *Chemical constitution.*

Contacts. Passage of electricity between small contact distances (Rother) 15; Si-C (Hartsough) 177; of W or Mo (Glasco-Lampen-Ges.) P 415; Pt-tipped Ni contact points (Eldred) P 1027; action of water vapor and C in oxidation of ferrous compds. (Doroshevskii) 2177; elec. make-and-break (Liebmann) P 3175.

Containers, for catalytic reactions (Anderson) P 399; preventing static charges in benzine (Lund-Lawerents) P 711; for sterile solns. (Rumpel) P 874; double-walled vacuum (Higbee) P 982; for combustible liquids (Rubbel) P 982 (Costantini) P 1138 (Masoni) P 1410; acid-resisting (Strzoda) P 1230; for slag (Wärme-Verwertungs-G.) P 1263; fused silica, for concg. H_2SO_4 (Marshall) 1372; calcn. of thickness of walls of pressure (Golz) 1409; for aerobic bacteria (Karp-Thomas) P 1628; coating acid-proof (Jordan) P 1674; chem. (Glauser) P 1863; for observing colors of liquids (Frisch) P 2011; for HF (Traun, etc.) P 2011; sterilizing (Quarzlampenges) P 2124; gas (Maschinenfab. Augsburg-, etc.) P 2168; sealing device for gas (Maschinenfab. Augsburg-, etc.) P 2168; prevention of corrosion of galvanizing pans (Diegel) 2217; for growing bacteria (Hertha) P 2395; cement, for liquids (Zürn) P 2581; milk bottles, etc. (Hays) P 2612; catalytic action of walls of, on decompn. of H_2O_2 (Elissaloff) 3015.

Contraction, vapor-pressure hypothesis of, of striated muscle (Roaf) 331; acid production in muscle during (Roaf) 633 (Porcelli-Titone) 2103; myothermic expts. in salt solns. in muscular (Weizsacker) 633; of smooth muscle and heat production (Snyder) 633; K, of the heart (Burridge) 3101.

Convallarin, and di-Ac deriv. (Lindner) 1760.

Convection constants, detg., of Pt wires and hot-wire anemometry (King) 1004.

Converter, ganister-lined (Gregson) 192; metallurgy of Cu in basic (Saint-Seine) 192; bottoms (Thomas) P 291; for treating mats, speisses, etc. (Haas) P 590; operating (Thiel) P 1028; conc. of Au in bottoms in Cu (Collins) 2210.

Conveying hot gases (Gasmotorenfab. Deutz) P 2472.

Conveying apparatus, for sludge, etc. (Polysius) P 733; for Cl gas (Aylsworth) P 1262; pneumatic (Brauer-Tuchorze) 2472.

Convulsions, convulsive action of strychnine (Paderi) 224; Ca ions and (Yanushke) 658; picrotoxin—epileptic (Pollock) 3287; decerebration and convulsant action of caffeine in frogs (Githens) 3297.

Cooking, reddening of meat and use of gas for (Schumann) 939; app. for cottonseed meal (French) P 1853.

Cooking utensils, alloy for (Bayliss) P 51; Ni (Vuk) 109; (Arnold) P 3335.

Coolidge tube in metallurgical research (Davey) 780; efficiency of production of X-rays from, —max. frequency of X-rays from, for diff. voltages (Rutherford) 3025.

Cooling and constitution of binary alloys (Gulliver) 432, 1597; natural chill of cast Fe (Thrasher) 433; curves (Hanemann) 878; in toxicological analysis (Le Roy) 1288; heat effects in, of metals (Laschenko) 2169; control of chill in cast Fe (Thrasher) 3201. *Patents:* gases (Jaubert) 131 (Leinert) 783; coke (Wärme-Verwertungs-G.) 859, 2145; elec. smelting furnaces (Magron) 1011; action of heat-neutralizing thermo-elements (Meyersberg) 1139; tempering oil (Dittmann-Neuhaus, etc.) 1300; hot potash solns. (Häberlein) 1377, 1378; rectifier anode (Brown, Boveri, et Cie) 1585; gelatin (Kind) 1857; Röntgen tube electrodes (Reiniger, etc.) 1877; clinkers in manuf. of cement (Park) 1988; utilizing, of slag (Wärme, etc.) 2056; furnace heads (Lackner) 2377; hot or molten fats, emulsions, etc. (Naamlooze, etc.) 2821; compressed air or gas (Soc. l'Air Liquide) P 3336; see also *Refrigeration.*

Cooling apparatus for hot calcined ore (Laist) P 50; use of, with S ovens (Pellet) 532; for hot liquids (Graef) P 540; for foods (Bull) P 943; for electrodes of vacuum tubes (Grisson) P 1156; for anticathodes of Röntgen tubes (Reininger, etc.) P 1156; for brown-coal briquets (Schlauf) P 1387; for coal-gas retorts (Pintsch A.-G.) P 1388; chimney, 1706; sprays for water, 2009; thermoelec. (Altenkirch) P 2010; calcns. for operation of, tower (Kent) 2697.

Coördinated compounds, attempts to resolve metallic salts of (Barker) 2895.
Coördination, residual affinity and (Morgan) 541.
Copaene (Semmler) 83.
Copaenedicarboxylic acid, and di-Me ester (Semmler) 83.
Copaeneketonic acid and derivs. (Semmler) 83.
Copaiva balsam oil, African (Semmler) 83; balsam (Deussen) 1968; oil, antiseptic action (Stockman) 2919.
Copal, Kauri (Fritz) 530; action of chlorinated solvents on (Coffignier) 972.
Copalillo oil (Schimmel & Co.) 2692.
Cop-holder for dyeing app. (Wood) P 2818.
Copper, sp. heat of (Harper) 10 (Keesom) 405; photoelec. measurements with oxidized, electrodes (Goldmann) 14; oxidation, soln. and pptn. of, in electrolytic solns. (Tolman) 44; chronic, intoxication (Harnack) 89; therapeutic value of, and its distribution in tuberculous organism (Corper) 106; soln. of, in HNO_3 (Drapier) 169; reproducibility of Cu electrode (Getman) 267; spectrum (Eder) 408; in 1913 (Anon.) 431 (Butler) 1024; sources of impurities in cathode (Addicks) 557; badly conducting film on, anodes in Cu cyanide solns. (Miller) 558; intern. consts. for 558; temp. and tensile tests of (Carpenter) 587; effect of P, Mn and Sn on phys. properties of (Karr) 589; melting cathode Cu in elec. furnace (Lyon) (Addicks) 755; hard-solder seams for (Golz) 780; electroplate in case-hardening (Paxton) 906; compressibility of (Richards) 983; change of valence of (Rebenstorff) 985; culture of *A. niger*, *Sterigmatocystis nigra* in media contg. (Javillier) 924; control of, plating solns. (Cowperthwait) 1151; effect of temp. on ductility of, wires (Lautz) 1166; solubility of W in (Rumschottel) 1169; chemist and Cu ind. (Herreshoff) 1293; calcn. of thickness of walls of, pressure vessels (Golz) 1409; at. wt. of, by electrolysis (Shrimpton) 1412; action on water (Jorissen) 1597 (Isnardi) 3211; permanent deformation of, produced by compression and by traction (Brillouin) 1597; sprays (Fonzes-Diacon) 1963; production in U. S. in 1914 (Butler) 2209; behavior of V toward (Giebelhausen) 2216; Ni and mechanical properties of (Stahl) 2217; injections of colloidal, and casein in human cancer (McClurg) 2267; heat treatment (Hayward) 2372; detg. wt. of deposit (Wilson) 2492; color due to, extractors (Greaves) 2723; place in present engineering field (Hawks) 2754; world's supply (Read) 2754; Kupfer (Borchers, book) 2869; elec. resistance of, wires (Henning) 3148; m. p. (Kaye) 3161; structure of electrolytic (Sieverts) 3173; cathode in electroanalysis (Guzmán Carrancio) 3186; action of hauerite on (Quercigh) 3191; metallography of (Campbell) 3200; phys. properties of (Hayward) 3200; boronized cast (Weintraub) 3205; hard drawn, wire (Batson) 3207; Brit., works 3332. *Patents:* -coated Fe ingots (Scheaffer) 50; hardening (Bittner) 288 (McLarty) 1297 (White) (Kich) 2220; coating Al with (Carbone) 291; coating for (Wagner) 292; billet (Page) 591; coating steel with (Page) 591; reinforcing, castings (Page) 591; compd. for uniting (Canzler) 593; electrodeposition of (Perreur-Lloyd) 761 (Hybinette) 1012 (Cowper-Coles) 1155 (Greenawalt) 2191; welding (Suzuki) 782; prep. for etching (Nefgen) 782; preserving (McLarty) 1229; removing gases from (Gleason) 1456; coated Ni steel leading-in wire for lamps (Eldred) 1721; -lime powder for plant treatment (Pleines) 2282; iron or steel sheets coated with (Monnot) 3214; rendering, non-oxidizable (Aller) 3214; steel wire coated with (Page) 3215.
Copper, analysis, sepn. from As (Balls) 277; sepn. from Sn and Sb (McCay) 277; electrolytic (Humphreys) 422 (Theel) 1728 (Nakao) 2493; in tap water (Winkler) 675; volumet. (Zuccari) 771; in Babbitt metal (Hagmaier) 772; in steel (Brown) 899; Nachweis, Bestimmung und Trennung der chemischen Elemente (Rüdisüle, book) 1159; in art. mineral waters (Reese) 1517; (Lyle) 1729; (Fraser) 1884; in Cu alloys (Lutts) 1885; detg. Au in blister (King) 2043; (Malatesta) 2200; battery assay (Price) 2202; reduction of Cu_2O in alc. vapor (Wedderburn) 2204; $Na_2S_2O_3$ soln. for (Grant) 2628; (Denigès) 2629; in presence of Sn (Coltman) 2427; guaiacum in (Atkins) 2911; in Cu ores contg. other metals (Nakao) 3042.
Copper, metallurgy of, in basic converter (Saint-Seine) 192; cathode potential in Cu refining (Guiterman) 266; in 1914 284; chloridizing roast (Dudley) 429; at Calumet (Carpenter) 429, 905; electrolytic, from ferric salt solns. (Hybinette) 562; (Mathewson) 1023; inds. of Canada (Wilson) 1024; Principles of Cu Smelting (Peters, book) 1026; designing small smelting plants (Christensen) 1163; nodulizing in (Payne) 1164; leaching (Ricketts) 1450, 3030 (Croasdale) 1451 (Austin) 2503, 2754; (Orem) 1451; treatment of Mich. Cu tailings (Leisk) 1451; mine and smelter (Tupper) 1452; hydrometallurgy—treatment of smelter flue dust and carbonate ore (Westby) 1594; treatment of mats in basic converter (Kolosnikow) 1594; precipitant for, from acid solns. (Thompson) 1738; reverberatory smelting (Pomeroy) 1738; Cu from an Fe blast furnace (Heike) 1739; (Binder) 2053; (Braut) 2056; smelting methods at Magistral, Mex. (Bissell) 2211; Brit. Columbia Copper Co.'s smelter (Brunton) 2212; electrolytic refining (Altneder) 2351 (Addicks) 2738 (Clark) 3030; Salida smelter (Weeks) 2503; hydro-electrolytic treatment of ore (Goodrich) 2737; modern plants (Repath) 2754; of South-

west (Douglas) 2754; advances (Laist) (Read) (Howard) 2754; metal losses in slags (Lathe) 2866; reduction works (Rutherford) 2867; in Japan (Kondo) 2868; lighting of electrolytic tank rooms (Harrington) 3032; roasting Cu-Ni ores (Manz) 3049; development of electrolytic Cu refining ind. in U. S. (Francke) 3171; (Borchers) 3197; extn. from burnt pyrite (Borchers) 3198. *Patents:* (Wagner) 26; (Bradley) 49; from carbonate and oxide ores (Ellis) 50; (Van Arsdale) 179; furnace for melting and refining (Rockey) 195; of S and O ores (Borchers) 271; (Hybinette) 438; (Rockey) 439; working pretreated Cu pyrite (Sutcliffe) 439; of ores contg. CuS and CuO (Carmichael) 591; (Frumkin) 782; (Page) 591; sepg., from Cu-Ni mat (Hybinette) 1009; electrolytic recovery of (Hybinette) 1013, 1434; (Addicks) 1584 (Perreur-Lloyd) 1154; extg. from cupriferous sands, etc. (Benedict) 1170; (Smith) 1279; (Azurit Vegyi, etc.) 1300; preventing fumes in smelting sulfide ores (Baggaley) 1455; smelting plant (Perkins) 1456; leaching and pptn. (MacDonald) 1601; (Hybinette) 1721; recovering Zn and Co from waste liquors (Larson) 1880; (Hybinette) 2037; pptg. from $CuSO_4$ solns. (Van Arsdale) 2376; (Vadner) 2376; electrolytic refining (Pyne) 2488 (Addicks) 2504; (Rankin) 2638; mixing flue dust with, mat (Baggaley) 2726; from solns. leached from ores (Bacon) 2759; (Weidlein) 2760; (Thum) 2870; converter for treating Cu mat (Howard) 3049; bessemerizing Cu mat (Herreshoff) 3050.

Copper acetate, compd. with hexamethylenetetramine (Vanino) 1049.

Copper alloys, manuf. (Westley) P 52; (Johnson) 587; Mn-Sn-Cu (Heusler) 193; noncorrodible (Coup) P 290; microchem. of corrosion (Whyte) 432; Ger. silver (Wood) 237 (Thompson) 433; standard specification for Cu unions 586; soln. velocity of, in HCl (Centnerswer) 745; forming Cu-Ni anodes for electrolytic sepn. (Hybinette) P 1009; Ni-Cu-Au-Ag (Parravano) 1024; with Ni and Pb (Parravano) 1025; British Standard Specification for, Three Piece Unions (book) 1026; with Fe for dynamo sheets (Rübel) P 1027; influence of c. ds. on adhesion of Ag deposits to high-Ni German silver (Mason) 1151; α,β-, with Zn (Whyte) 1294; Cu-Zn and Cu-Zn-Pb (Parravano) 1453; hardness of, with Zn (Meneghini) 1453; constitution of, with Sn (Haughton) 1597; with Al (Andrew) 1597; Cu-Ni-Al (Read) 1598 (Joyce) P 2505; with P (Schulte) P 1745; analysis of (Lutts) 1885; fatigue of (Jonson) 2372, 2637; for dense castings (Vickers) P 2759; anti-friction (Plügel) P 2761; transformations in Au alloys with (Kurnakov) 3203; and brass founding (Reason) 3205; Cr-Cu-Ni (McFarland) 3205; Cu-Sn-Zn (Hoyt) 3205; hardness of Cu-Zn (Meneghini) 3206; Brit. Standard Specification for (Eng. Standards Committee, book) 3213; see also *Brass; Bronze.*

Copper ammonobenzenesulfonates, Cu′ and Cu″ salts and derivs. (Franklin) 1016, 3037.

Copper ammono-*p*-toluenesulfonates, cuprous and cupric and diammonate of cuprous (Franklin) 1016, 3037.

Copper boride (Gleason) P 595.

Copper carbonates, Cu_2CO_3 (Carles) 2358.

Copper chlorides, C_2H_2-CuCl reaction for water (Weaver) 279; and growth of corn (Caldwell) 685; compd. of $CuCl_2$ with hexamethylenetetramine (Vanino) 1049; compds. of $CuCl_2$ with betaine, etc. (Pfeiffer) 2652; action of $CuCl_2$ on org. S compds. (Rây) 2890; in concd. solns. (Cabrera) 3167.

Copper compounds, action of C_2H_2 on—cuproacetylene compds. (Llorens) 767; with *o*-hydroxyacetophenone (Pauly) 1052; of 3,3′-diamino-4,4′-dihydroxyarsenobenzene (Farbw.) P 1829; thermochem. of (Rolla) 2337; of thio-protein substances (Uhl) P 2423; protein- (Born) 3071; new Cu deriv. of glycocoll (Ville) 3223; basic Cu formates (Fowles) 3231.

Copper cyanide, badly conducting film on Cu anodes in, solns. (Miller) 558; economy and efficiency of (Proctor) 1151; plating solns. (Weber) 1151.

Copper deposits, geology of Burro Mountains district, N. Mex. (Somers) 1732; pegmatite lode of Otjozonjati, German-Southwest Africa (Westphal) 1733; mines of Norway (Udhany) 1889; in red beds of Oklahoma (Fath) 2047; of San Cristobal, Santo Domingo (Donnelly) 2497.

Copper diaquo-tetraammine iodate (Ephraim) 2194.

Copper glycine sulfate (Ville) 3223.

Copper group, analysis (Gilmour) 1725.

Copper hexaammine chlorate (Ephraim) 2194.

Copper hydroxide, action of ammoniacal, on cellulose (Connerade) 861.

Copper nitrates, ultraviolet spectrum of $Cu(NO_3)_2$ (Massol) 14; in concd. solns. (Cabrera) 3167.

Copper ores, Arizona (Hill) 44; ind. in Norway 585; leaching (Flynn) 1729; sepn. from gang (Bacon) P 1743; Cu_2S from (Bacon) P 2759.

Copper oxides, coating Al with CuO (Carbone) P 291; CuO (Cochlovius) P 516; system: PbO–CuO (Cunningham) 567; CuO electrodes (Mello) P 762; fractional combustion of gases over CuO (Terres) 1239; supposed vanadic acid from Lake Superior is Cu_2O (Schaller) 1447; thermal e. m. f. of CuO and Cu_2O (Brown) 2182; reduction of Cu_2O in alc. vapor (Wedderburn) 2204.

Copper pentaammine iodate (Ephraim) 2194.

Copper-pyridine tetrathionate (Calzolari) 2845.

Copper salts, recovering (Bourgeot) P 29; cuprous salts of O acids (Daniels) 1586; of polymethylenebisimino acids (Coutelle) P 2696; reduction of cupric salts by sugars (Cramer) 2990; "double complexes" in ionization of (Blomberg) 3153; magnetochemistry of, and magneton theory (Cabrera) 3167.

Copper-salvarsan (Fabry) 1805; treatment of lupus (Fabry) 1805.

Copper sucrates, water-sol. neutral (Landau) P 2569.

Copper sulfates, dehydration (Merwin) 31; purifying water with 342; basic (Fonzes-Diacon) 565; (Azurit Vegyi, etc.) P 1300; treatment of reservoir 1520; ind. prepn. (Falciola) 1534; O from bleaching powder, H_2O and (Griswald) P 1832; in purification of swimming pools (Thomas) 1959; substitute for, in combating Peronospora (Gvozdenovic) 1963; detg. in com. Cu vitriol (Incze) 2203, 3188; influence on wheat (Voelcker) 2281; removing As from (Martin) P 2488; migration of ions and transport of NH_3 in ammoniacal solns. of $CuSO_4$ (Reychler) 2616; in concd. solns. (Cabrera) 3167; electrolysis of (Addicks) 3172.

Copper sulfides, crystn. of (Merwin) 42; dispersion and pptn. of, from colloidal suspensions (Tolman) 44; detg., in mixts. of one another (Posnjak) 423; reducing CuS to Cu_2S (Bacon) P 2759; Cu_2S from ores (Bacon) P 2759; CuS in stomach (Meneguzzi) 3296.

Copper tetraammine chlorate (Ephraim) 2194.

Copra, ind. position of 1205; drying (Hines) 2820; drying, mixing, moistening (Annison) P 3108.

Coprosterol, conversion of cholesterol into (Windaus) 1327; and double compd. with cholestanol (Windaus) 2246.

Corbino effect (Adams) 1576, 2348.

Cord, fiber from old (Funke) P 1396; waterproofing ship- and net-lines (Borks) P 2458.

Cordials, nutrient value of cod liver oil (Street) 953.

Cordierite (Oppenheimer) 2859; gneiss (Sokol) 188.

Cordierite-norite (Watt) 428.

Cordite, cutting (Schaschke) P 153.

Cores, drying (Böcking & Cie) P 1896; plastic mixt. for making, of obturators of breech-loading ordnance (Gerdom) P 2296; coating for metal (Brosch) P 2761.

Cork, Its Origin and Ind. Uses (Strecher, book) 1098; insulating stones (Grünzweig & Hartmann) P 1100; whitening and glazing (Debore) P 1832; products (Bond) P 2297; flour from osier bark (Petz) P 2712; expanding, particles (Grunzweig) P 3333.

Cork, substitute (Paschke) P 1227; (Oesterreich., etc.) P 2434; (Marsa) P 2799.

Corn, trimming of leaves of (Manaresi) 94; growth expts. (Harris) 502 (Caldwell) 685; paper pulp from stalks (Burton) P 525; influence on growth of, diet (Hart) 643; acidity and soundness of (Besley) 828; N in (Moskvicher) 1189; chem. and, products ind. (Bedford) 1354; acidity (Besley) 1354; rare mineral elements necessary for development (Mazé) 1362; cultivated for sugar (Boyer) 1406; steaming of,—influence on time of refining (Kusserow) 1527; biochem. O demand in, products waste (Lederer) 1956; chem. intoxication and mutation of (Jungelson) 2102; dark color in canned (Bigelow) 2405; P metabolism of lambs fed alfalfa hay, linseed meal and (Ross) 2774; detasseling (Heckel) 2921; manuf. of maize sugar (Doby) 2993; action of org. substances on (Ciamician) 3271.

Cornea. See *Eyes.*

Corner pieces, of ceramic masses (Kaehler) P 2807.

Corn meal (Simons) P 943; P_2O_5 in (Crae) 1192; compn. (Winton) 2553.

Cornutine, in *Secale cornutum* (Wastenson) 1828.

Corona, from d. c. circuits (Woodruff) 25; corona loss curves (Peek) 1277; produced by continuous potentials (Chubb) 1877; in oil (Peek) 2487.

Corpuscles. See *Electrons; Blood corpuscles*

Corpus luteum, biol. function of (Seitz) 219; menstruation and pregnancy and (Miller) 2933; action on mammary glands (Ott) 3284.

Corrosion, history (Bengough) 49; Mo and, of steel (Friend) 49; and pickling of Fe (Richardson) 286; of Fe and steel pipe (Buck) 286 (Aston) 1893 (Friend) 1893, 2373 (Dunkley) 2757; anti-rust comp. (Howe) P 387 (Daumiller) P 1126 (Eberhard) P 1126, 2459 (Elliot) (Zschokke) P 1551 (Standard Lack.-und Farbw.) P 1552 (Haefner) P 2221 (Perry) P 2601 (Lucock) P 2997; Mn and, of steel (Desch) 431; microchem. of (Whyte) 432, 1294; of Zn (Frost) 435; of Fe in detn. of strengths of acids (Friend) 542; metal coloring by, process (Blassett) 589; tests for, of reinforcing steel (Gardner) 853; rendering Al resistant to (Pucillo) P 1027; of Pb (Lambert) 1167; of boilers (Haythorpe) P 1215 (Ingham) 1454 (Kohen) (Jones) (Heinzelman) 2680; of metals (Evans) 1295; of non-ferrous alloys (Desch) 1295; in galvanized Fe pipes (Meyer) 1599; preventing electrolytic 1878; paint vehicles as protective agents against (Toch) 2000; prevention in galvanizing pans (Diegel) 2217; preventing, of Fe (Burgess) P 2219; rust-proof articles from Al and heavy metals (Lang) P 2221; removal (Friend) 2373; of Fe in aq. solns. of inorg. salts (Friend) 2373; external, of cast Fe pipe (Pugh) 2757; of metal flume sheets (Harris) 2757; anti-corrosive alloy (Talbot) 2760; action of CCl_4 (Ferguson) P 2795; resistance to (Buck)

Digitized by Google

3211; influence of diff. elements upon, of Fe (Wilson) 3212; of Fe and steel (Binnie) 3212; see also *Coating; Paints.*

Corrosive liquids, handling (Clifford) 128.

Corrosive sublimate. See *Mercury chlorides.*

Corset stays (Jungfer) P 1555.

Corundum (Barlow) 2206; (Pettigrew) P 2489.

Cosmetics, Pb poisoning from use of (Robinson) 1204; talc in, during war time (F.) 2002; analysis of (Adam) 1531; Pb neuritis from (Sante) 2403; (Pazdzierski) P 3118; prepn. and manuf. of (Askinson, book) 3329.

Cossets, dehydrated (Wiechmann) 2463.

Costene, α- and β- (Semmler) 212.

Costol and acetate, etc. (Semmler) 211.

Costusic acid and Me ester (Semmler) 76.

Costusolactone (Semmler) 76.

Costus root oil (Semmler) 76, 211.

Costyl chloride (Semmler) 211.

Cotton, testing, of tents (Strunk) 39; nitration of (Stocker) 152; structure of, fiber (Levine) 382; fireproofing (Perkin) P 384; fertilizers and maturity of (Williams) 685; nitrocellulose from (Schwalbe) 715; microscopy of (Herzog) 719; bleaching (Sansone) 863; imitation of color of Egyptian 863; satinizing (Dutsche) P 1251; cleaning, waste (Zimmermann) P 1376; fiber proteins in bleaching (Levine) 1548; Development and Properties of Raw (Balls, book) 1846; treating to make it resemble wool (Heberlein) P 1997; silk-like (Hermsdorf) P 1999; dyeing with "Cuano" (Steiner) 2151; fiber from waste portions of, plant (Marsden) P 2311; wool-like, fabric (Heberlein & Co.) P 2315; impregnating (Knoll) P 2458; paper from, stalks (Olds) 2708; conversion of, sticks into charcoal (McKillop) 2790; influence of neutral salts on tendering of, with acids (Fort) 3131; tendering of, by org. acids in steaming (Pilkington) 3131; action of mineral acids on (Cohen) 3132; see also *Calico printing.*

Cotton root bark (Power) 352.

Cottonseed, sterilizing and preserving (Barrow) P 227, 3372; prepg. to ext. oil (French) P 390; N and fat in (Wells) 974; comp. of (Hare) 1128; gossypol in (Withers) 1516; foods from (Falls) P 1952; prepg. for storage in bulk (Carr) P 2003; crushed and linters obtained 2321; heating of (Barrow) 2604.

Cottonseed cake, detg. cottonseed hulls in (Tilson) 2273.

Cottonseed hulls, detg. in cottonseed cake and meal (Tilson) 2273.

Cottonseed meal, availability of N of (Hartwell) 644; feeding value (Lindsey) 1355; cooking (French) P 1853; detg. lint in (Brackett) 2407; detg. crude fiber in (Francis) 2677.

Cottonseed oil, hydrogenating (Moore) P 389 (Ellis) P 1698; Uts's modification of Halphen's reaction for (Gastaldi) 389; Halphen reaction with (Condelli) 728; improving flavor (Sulzberger) P 829, 1813; refining (Baskerville) P 1128; chemist and, ind. (Wesson) 1399; analyses (Knigge) 2989; toxic (Symes) 3101.

Cottrell process, treatment of Ag furnace fume by (Aldrich) 2839.

Coulometer, H (Hatfield) 176; complications at anode in Ag (Richards) 1431.

Coumaranone and a new N-O ring (Stoermer) 1054; ring opening and closing in derivs. (v. Auwers) 806.

Coumarin (Kinzlberger & Co.) P 848; formation of derivs. (Jordan) 1604; (Bargellini) 2239.

Coumarinic acids, prep. of stable (Jordan) 1604.

Coumarinoline and derivs. (Stoermer) 1054–5.

Coumarone resin (Wendriner) P 2001.

Coupling, screw, for acid pipe-lines (Fritzweiler) 873.

Court-plaster (Scheidig) P 2428.

Covellite (Merwin) 1888; at Butte, Mont. (Thompson) 1888.

Cover, desiccator, 2725.

Covolume of gases evolved by explosives (Berthelot) 3152.

Cows, effect of alkali water on dairy (Larsen) 1940.

Cracking. See *Petroleum refining.*

Cramps, alkalescence of blood during muscle (Sass) 657.

Crayfish, extractives from (Kutscher) 487.

Crayon (Smith) P 1100.

Cream, treating, with gas under pressure (Fox) P 110; estg. fat in (Blanck) 226; expansion of (Bearce) 2782; mucus in (Stören) 2950; clotted (Sadler) 3106; see also *Milk; Milk, analysis.*

Creamery, disposal of, refuse (Wilson) 679 (Crohurst) 2413.

Cream of tartar. See *Potassium tartrate.*

Creatine, elimination by diabetics and nephritics (Lampert) 96; (Norsk Tangsyndikat) P 362; reaction of, with dil. alkali (Ellinger) 467; formation of, in animals (Kutscher) 487; in starvation (Graham) 646; analysis (Castantino) 1792 (Morris) 1926 (Janney) 2771; as index of pregnancy intoxication (Van Hoogenhuijze) 2669; action of arginase on (Clementi) 2909; origin (Baumann) 2936; removal of acetoacetic acid from urine in, detns. (Graham) 3080; comparative physiology of creatinine and (Morse) 3090; excretion during fast (Zeman) 3277; influence of protein feeding on elimination of, in starvation (Rose) 3277.

Creatinine, elimination by diabetics and nephritics (Lampert) 96; in starvation (Graham) 646; excretion of, during a creatine-free diet (Ringer) 817; in leguminous seeds (Oshima) 827; in blood in nephritis (Myers) 1502, 3287; detns. (Costantino) 1792 (Morris) 1926; (Bayer and Co.) P 1830; conversion of glycocyamidine into isomers of (Johnson) 2901; in muscles (Scaffidi) 2931; removal of acetoacetic acid from urine in, detns. (Graham) 3080; double compd. with $AgNO_3$

Digitized by Google

(Smorodintzev) 3088; comparative physiology of creatine and (Morse) 3090; test of diseased kidney functioning in the pregnant (Orlovius) 3098.

Creatinuria (Taylor) 2663; relation to changes in sugar content of blood (MacAdam) 2929.

Creosote, effect on strength of Oregon fir piling (MacFarland) 140; efficiency of coal-tar, against marine borers (Teesdale) 140; in preserved timbers (Alleman) 240 (Reilly) 854; wood blocks treated with (Cherrington) 703; toxicity of, distillates for *Xylotrya* (Shackell) 704; toxicity for *Xylotrya* (Shackell) 704; specification for, soln. (Schrenk) 703, 1236 (Reilly) 2138; resistance of conifers to injection with (Teesdale) 2138; Port Reading plant 2703; prepn. (Maltbie) P 2796; emergent stem correction for thermometer in, oil distn. flasks (Wilhelm) 2977.

Crepe, manuf. (Courtaulds) P 3134.

Creping, app. for rubber, etc. (Gass) P 1859.

"Cresolinum vienense" (Schaefer) 949.

Cresols, liquor, saponatus (Finnemore) 353; comp. of compd. soln. of (E'We) 513; sepg. *m*- and *p*- (Terrisse) 1830; condensation products with casein and HCHO (Kühl) P 1849; new substituted (Hill) 2527; condensation products from phenols, HCHO and (Heinemann) P 2801; estn. of phenol in presence of *p*- (Siegfried) 2918; prepn. of casein-, spirit lacquers (Kühl) 2987; see also *Soaps*.

Cresorcinolphthalein chloride (Kehrmann) 325.

Cresotinic acid, action of Mg org. compds. on Me ester (Berlitzer) 1466.

Cresoxyethyl bromide, *o*-, *m*-, and *p*-, and derivs. (Jacobs) 2076.

Cresyl, fumigation with (Seidelin) 2118.

Cresyldi-*m*-nitrosalicylic acids and Et ether (Purgotti) 70.

Cresyl-*m*-nitrosalicylic acids (Purgotti) 70.

Critical constants, detg., of N, CO, O and of CH_4 (Cardoso) 2474, 2828.

Critical point of O and N (Onnes) (Crommelin) 988; Fe-C diagram and, $A_{1,2,3}$ (Stead) 1166; fortuitous d. changes and opalescence at (Ornstein) 1569; detn. of, in Fe, steel and alloys 3145.

Critical ranges of pure Fe (Burgess) 194.

Critical temperature. See *Temperature, critical*.

Crookes glass, transmission of radiant energy by (Hartridge) 3069.

Crops, effect of previous vegetation on following (Skinner) 683; on alkali land (Hansen) 683; residue in soil (Schulze) 1085; mutual influences of, in relation to N (Kellerman) 1650; ripening of field and food (Pettera) 3113; adaptability of Piedmont soils to different (Williams) 3318; see also *Electroculture*.

Crotalin "Spangler," 954.

Croton eliotianus (Cash) 105.

α-Crotonic acid, decomp. to AcH (Neuberg) 59.

Crucibles, igniting (Kaus) P 398; triangle for supporting 537; lining for (Ges. zur Ausbeutung, etc.) P 2222.

Cruciferae, mustard oils in (Blanksma) 1613.

Crude fiber, detn. in flour (Bauer) 1809; "Weender" method for (Fanto) 1950; detg., in cottonseed meal (Francis) 2677.

Crusher for superphosphate (Bakema) P 2576; (Crosby) 1706; plant for ore (Bradley) 2754.

Crushing, conc. by 1024; effect on detn. of ash of coke (Eastaugh) 2305; hard substances (Kretzmann) P 2434; cyanide process (Mills) 2867.

Crustacea, growth and reproduction in (Smith) 1513.

Cryohydric point of $(NH_4)_2Mg(SO_4)_2$ (Perlezza) 1571.

Cryolite, production in 1913 (Buchard) 515.

Cryophyllite (Asch) 3194.

Cryoscopic constants of HgI_2 (Beckmann) 262; of $PhNO_2$ (Böeseken) 445; variation of, with mol. wt. of solvent (Guzman Carrancio) 3157.

Cryoscopy, chloral and bromal hydrates as solvents (Beckmann) 171; detection of added water in milk (Maclaurin) 491; of molybdic acid (Mazzucchelli) 544; calc. of equil. const. by means of (Goebel) 745; org. complexes of permolybdic acid (Mazzucchelli) 878; of dimethylpyrone salts (Plotnikov) 2512; capacity of $PhNH.NH_2$ to form phenylhydrazones (Oddo) 2525; phenylhydrazine semihydrate as a solvent (Oddo) 2526; see also *Freezing point*.

Cryptogams, modifying anti-cryptogamic prepns. (Soc. de produits, etc.) P 2791.

Crystal form. See *Crystallography*.

Crystallization, of undercooled water (Walton) 168; salts contg. 2 solvents of (Marsh) 171; of ice (Hartmann) 261; of sphere of $K_2Cr_2O_7$ (Artemeev) 566; forcing spontaneous (Tammann) 875; in silicate liquids (Bowen) 902; of sugar in factory sirups and final products (Claassen) 975; app. (Häberlein) P 1139; fractional, of picrates of rare earths of didymium group (Dennis) 1284; in ternary systems of chlorides of univalent and bivalent metals (Liebisch) 1414; spontaneous (Othmer) 1866; multiple (Beutell) 1887; velocity of, from aq. solns. (Campbell) 2022; of concd. $MgCl_2$ liquors (Hof) 2293; of haplobasaltic, haplodioritic and related magmas (Bowen) 2633; rythmic, of S (Kohler) 3153; see also *Sugar manufacture; Water of crystallisation*.

Crystallizers (Passburg) P 259; (Sauerbrey) P, 2435; for large crystals (Elektrochem. Werke) P 3338; see also *Sugar manufacture*.

Crystallography, demonstration app. (Voigt) 1; Geometrical Properties of Crystals (Walker, book) 19; of calcite and sulfides of Fe, Cu and Zn (Merwin) 42; hemimorphic ice crystals (Stecher) 42; X-rays and crystal structure (Bragg) 167, 1579, 2838 (book) 410, 3171 (Glocker) 3169; of systems formed by

$PbCl_2$ with chlorides of univalent metals (Treis) 181; app. (Stöber) 257; internal structure of crystals (Terlanday) 280; twinning and martensitic structure (Desch) 436; of succinic acid series (Stefl) 462; cocoline in butter (Gillet) 492; of minerals from Latium (Rosati) 773; structure and chem. constitution (Pope) 875 (Groth) 2174; deformation of rock-salt crystal (Terada) 876; Einführung in die Krystallographie (Schulz, book) 1004; changes in crystal angle of related substances with change of temp. (Riune) 1020; of nitro derivs. of benzene (Steinmetz) 2088; topic parameters and morphotropic relationships (Barlow) 2473; enantiomorphism of structure (Barlow) 2473; polarization microscope for (Metzner) 2731; structure of spinel group of (Bragg) 2731; chem. compn. and crystal form (Panebianco) 2830; methods of naming crystal forms (Milch) 2830; system of crystals (Viola) 2830; circular polarization and theories of crystal structure (Berek) 3021; crystal structure (Schoenflies) 3152; form of polyhalite (Görgey) 3192; Numerical Data of (Spencer, book) 3197; of Ph_2 and its derivs. (Mieleitner) 3227.

Crystalloids, stalagmometric studies of solns. of,—diffusion in surface layer (Berceller) 2902.

Crystals, indications of at. structure presented by (Barlow) 20; twinning and martensitic structure (Desch) 436; velocity of growth and external symmetry (Shubnikov) 541; temp. oscillations and formation of (Shubnikov) 542; X-rays and interference in (Friedrich) 554 (Laue) 1581; X-ray expts. with cubic (Ewald) 554; formation in metals (Robin) 587; translation-hypothesis and plasticity of metal (Szochralski) 779; as under microscope (Wright) 902; reflection of X-rays from (A. B.) 1141; hollow spiral prismatic, of ice (Fermor) 1288; -grinding goniometer (Wright) 1410; removing from solns. (Sauerbrey, Maschinenfab.) P 1537; X-rays and (Bragg) 1579, 1581; sifter and comminutor (Akt.-Ges. Chem. Prod. Fabr.) P 1708; growing, for measurement (Blake) 1709; microscopic mounts of metal (Bowman) 1709; noteworthy (Cathrein) 1731; construction of cubic, with theoretical atoms (Crehore) 2473; grinding (Goldschmidt) 2826; as mol. compds. (Pfeiffer) 3000; sensitiveness of detectors (Giurgea) 3000; visualization of space lattice (von Laue) 3000; asymmetry in rate of dissolution of, on diff. faces (Lebrun) 3157; metallic twinning of, by direct mechan. strain (Edwards) 3202; method of union of "Quellungswassers" in "quellbaren" (Katz) 3256; method of union of water taken up by hemin (Katz) 3256; see also *Mixed crystals.*

Crystals, liquid. See *Liquid crystals.*

Crystal structure. See *Crystallography.*

Cubeb oil (Schimmel & Co.) 2692.

Cucumbers, downy mildew of (Stone) 1363.

Culture mediums, metabolism of certain bacteria in various (Kendall) 215; lipase developed by tubercle bacilli in, of varied comp.—lipolytic activity and proteolysis of tubercle bacilli in, of varied comp. (Kendall) 217; for detg. bacteria in soils (Conn) 470; org. constituents of culture soln. and mycelium of molds from soil (Sullivan) 835; influence of, on action of inulase of *A. niger* (Kiesel) 923; (Odier) P 1344; and protein decomp. in yeast (Zaleski) 1796; for *B. coli* (Ayers) 1810; detg. S in (Redfield) 1929; dehydrated (Bramigk) P 2395; adaptation of organisms of lactic fermentation to (Richet) 2101; for bacteriol. exam. of water (Chamot) 2678; soil org. matter as, for *Azotobacter* (Mockeridge) 3082; regeneration of used endoagar (Mohorcic) 3260; for cholera bacilli (Aronson) 3268.

Cuminaldehyde, xylylhydrazone, etc. (Padoa) 1318-9; 4,4'-diphenylsemicarbazone (Toschi) 2388.

Cuminil, 1,3,4-xylylosazone (Padoa) 1320.

2-*s*-*ψ*-Cumylazo-1-naphthol and Me and Et ethers, etc. (Charrier) 793.

Cupellation, losses (Sharwood) 2865.

Cupferron, sepn. of V and P with (Rodeja) 2202.

Cupola furnace. See *Furnace, blast.*

Cuprite, thermal linear coeff. of expansion of (Röntgen) 574.

Cuproacetylene compounds (Llorens) 767.

Cupropotassic solutions (Pellet) 1699.

Curare, heat regulation in (Freund) 478; poisoning (Polimanti) 661; curarizing action of scopolamine (Obré) 2552; lethal dose of (Gros) 660.

Curd, soaps (Meyerheim) 159; solubility of, in NaCl soln. (Orla-Jensen) 918.

Curdling. See *Coagulation.*

Curie-Langevin law of magnetization (Holm) 2484.

Curie law (Oosterhuis) 410.

Curing, of tobacco (Garner) 511 (Bernardini) 2792; double, in plantation white sugar manuf. 532; meat (Burkle) (Servatius) P 673 (Schwenger) (Trescott) P 1355; smoke-, rubber latex (Ripeau) 980; and strength of concrete (Withey) 1235.

Currant juice (De Waal) 2949.

Currents. See *Electric current.*

Cus-cus oil (Singh) 234.

Cuscuta trifolii (Marettini) 1797.

Cusparine, isomerism and degradation (Troeger) 2079.

Cutout, for series W lamps (Lux) 1720.

Cutting, round holes through glass (Manson) 3; burner for, metals (Kongsbak) P 782; La taille économique des métaux par les aciers à coupe rapide, d'apres les expériences de F. W. Taylor (Massot, book) 1169; app. for soap (Sax & Co.) P 1403; Oxy-Acetylene

Dichloromercuri compound of the pyrazolone series (Schrauth) 304.
2,3 - Dichloro - 3 - methylbutane (Matthews) P 2291.
Dichloromethyl α-chloroethyl ketone (Blaise) 786.
Dichloromethyl ethyl ketone and dioxime (Blaise) 786.
4,4' - Dichloro - 3 - nitrobenzophenone (Maron) 307.
2,4 - Dichlorophenylhydrazine and derivs. (Chattaway) 1037.
α,α' - Dichlorophorone (Heilthaler) 56.
2,6 - Dichloropicryl - p - phenylenediamine (Morgan) 608.
Dichloroplatinomethyldihydroxytriazine (Ostrogovich) 1321.
Dichloropulenenone, solid polymer of (v. Auwers) 3236.
α,α - Dichloro - β - sulfidodicrotonic acid derivs. (Scheibler) 3246.
Dichlorotetraacetylcyclohexanetetrol, α- and β- (Griffin) 2091.
Dichlorotoluphenone (Nastyukov) 2507.
Dichlorotriacetylcyclohexanetetrol (Griffin) 2091.
3,5 - Dichloro - 2,4,6 - trioxyheptane [or **-triketoheptane**] (Datta) 1064.
Dichroism, circular, of amethyst (Perucca) 1159.
Dichromates, compds. of chromates and, with $Hg(CN)_2$ (Strömholm) 1437.
Dicitronella oxide and derivs. (Spornitz) 78.
Di[1 - cyano - 2 - anthraquinonyl]1',5' - anthraquinone dithioether and thioxanthone (Schaarschmidt) 1758–9.
Di - o - cyanobenzoylacetylacetone (Scheiber) 915.
Dicyanodiamide (Grube) P 1087.
Dicyanodicarbylaminoplatinum (Chugaev) 87.
α,ε - Dicyano - β,δ - dimethylhexadienoic acid(?), Et ester and Br deriv. (Simonsen) 2517.
2,2' - Dicyano - sym - diphenylurea (Borsche) 309.
Dicyclohexyllead compounds (Grüttner) 804
Dicyclohexyltin compounds (Grüttner) 804.
Di - β - dimethylaminonaphthyl sulfide (Reeve) 2891.
4¹,4² - Di[dimethylamino] - 4³ - nitrilotri - phenylmethane and derivs. (Rassow) 2640.
Didymium group, fractional crysts. of picrates of rare earths of (Dennis) 1284.
Didymium xanthopus (Heiser) 218.

Diphenyl ditelluride (Lederer) 3235.
Diphenyldi - *p* - tolyl - *o* - disulfamide and K salt, etc. (Witt) 308.
Diphenylethanoldioxytriazine and derivs. (Bougault) 1174.
Di - *β* - phenylethylacetonitrile (Cohen) 2887.
Di - *β* - phenylethylamine *p* - disulfide and salts (King) 1467.
Di - *β* - phenylethylcyanoacetic acid, Et ester (Cohen) 2887.
2 - Diphenylhydroxyaminomethylenenaphthoquinone - 1 - oxime (Preissecker) 598.
1,5 - Diphenyl - 3 - hydroxy - 1,2,4 - triazole and derivs. (Oddo) 2524.
Diphenyliminodiacetic acid and derivs. (Shlexinger) 3054–5.
Diphenylketoximebenzenesulfonate (Kuhara) 1613.
***β*-Diphenyllactic acid**, products of dehydration of (de Fazi) 3064.
Diphenylmetacetaldehyde (Stobbe) 207.
Diphenylmethane as soap perfume (B. B.) 728.
Diphenylmethane series, synthesis in (Thorp) 1067; halogen derivs. of hydrocarbons of (Nastyukov) 2507.
***α,α′* - Diphenyl - *β* - methyl - *β′* - benzylidenetetrahydropyrone** and dibromide (Ryan) 75.
Diphenylmethylcarbinol (Pereira) 1327.
1,2 - Diphenyl - 3 - methylcyclopentan - 1 - ol - 5 - one (Anschütz) 459.
3,5 - Diphenyl - 4 - methylisoxazole (Marshall) 2224.
1,3 - Diphenyl - 4 - methylpyrrole (Almstrom) 2875.
2,3 - Diphenyl - 5 - *α* - naphthylpyrazoline and derivs. (Albrecht) 911, 912.
Diphenylosazones and phototropy (Padoa) 1320,
2,6 - Diphenylpentoxasole and -HCl (Gabriel) 2876.
Diphenylphosphinic acid and piperidide (Michaelis) 1334.
Diphenylphthalimidyl - *α* - ethylbutyric acid (Freytag) 1915.
Diphenyl - *α* - phthalimidyl - *α* - methylbutyric acid (Freytag) 1916.
2,3 - Diphenylpiperazine - 2,3 - dicarboxylic dinitrile and corresponding acid and derivs. (Schlesinger) 74.
Diphenylpiperidylurea and -HCl (Dehn) 2900.
3,5 - Diphenylpyrazoline and derivs. (Kizhner) 3051.
Diphenylpyridinecarboxylic acid, Ag salt (Ciusa) 1326.
Diphenylselenide - *o* - carboxylic acid and derivs. (Lesser) 81.
4,4′ - Diphenylsemicarbazide as reagent for C:O derivs. (Toschi) 2388.
Diphenylsuccinic acids, *d-*, and Na salt (McKenzie) 1036; configuration (Wren) 2223.
Diphenyl telluride, -$HgBr_2$ and -HgI_2 (Lederer) 3246.
Diphenyltetracarboxylic acids, 2,3,2′,3′ and 3,4,3′, 4′, and Me esters, etc. (Kenner) 206.
1,4 - Diphenyl - 2 - thiohydantoin (Komatsu) 2088.
Diphenylthiosemicarbazides derivs. and AcCl addn. compd. of (McKee) 3223.
Diphenylurea chloride, action on org. bases (Dehn) 2899.
2,3,6,7 - Diphthaloyl - 9 - ethylcarbazole (Copisarow) 2520.
Diphthalylbenzidine and derivs. (Simonyi) 88.
Diphthalylglycylmalonic acid, di-Et ester (Gabriel) 313.
Diphthalylhydrazine, dihydrazine salt (Kenner) 206.
Diphtheria, normal, immunity (Gröer) 103; action of, toxin on rat (Pettit) 820; sp. precipitin in blood of people injected with antidiphtheritic horse serum (Wells) 1197; *p*-$Me_2NC_6H_4CHO$ reaction in (Rachmilewitsch) 1804; detoxification of, toxin (Schumacher) 1804; detection and concn. of, toxins (Glenny) 3262; anti-, serum (Babes) 3290; vascular response in poisoning from, toxin (Myers) 3293.
1,4 - Dipiperonylideneangelicalactone (Borsche) 2245.
***α,β* - Dipiperonylidenelevulinic acid** (Borsche) 2245.
Dipoles, Debye's theory of mol. (Rubens) 3164.
Dipping, acid dip installation (Perls) 890.
Dipping fluids, arsenical (Holborow) 503 (Chapin) 2419; NaOH and S (Shilston) 686; field test for lime-S (Chapin) 686; assay of

Digitized by Google

arsenical (Chapin) 686; concd. animal (Chapin) P 1654; chem. control of cattle (Williams) 2560.

Dipropionin, optically active (Abderhalden) 311.

Dipropylammonium hexabromo-osmiate (Gutbier) 1439.

Dipropylammonium hexabromoselenate (Gutbier) 1436.

Dipropylammonium pentachlororuthemiate (Gutbier) 2196.

***dl* - Dipropylcyanoacetic acid** and derivs. (Fischer) 2522.

4,9 - Dipropyl - 4,9 - dodecanediol (Bouvet) 2639.

Dipropylisobutylcyclohexylmethane (Halse) 3232.

Dipropyl - *p* - phenylenediamine, hemisulfate (Karrer) 3239.

Dipseudocumyldibromoethylene (Wenzel) 600.

Dipseudocumylethane and Br derivs. (Wenzel) 600.

Dipseudocumyl ketone (Wenzel) 600.

Dipseudocumylmethane (Wenzel) 599.

α,α - Dipyridylamine (Chichibabin) 1902.

α,α-Dipyridylethylene and dibromide (Harries) 2880.

2,2 - Dipyridylglyoxal (Harries) 2880.

α - Dipyrrryldiphenylmethane (Chelintzev) 2055.

α,α - Dipyrryl ketone (Chelintzev) 1472.

Dipyrrylmethene derivatives (Piloty) 82; with pigment character (Fischer) 804.

Dirt, test for, in air supply (Moss) 2683.

Disalicylatodiamminechromiates (Barbieri) 2849.

Discharging, superphosphate chambers (Lütjens) P 2420; cake from leaf filter for slimes (Butters) P 2801.

Discharging apparatus for clinker (Woolson) P 258; for gas producer (Moore) P 1386; for priming caps (Köhler) P 1995; for drying chambers (Müller) P 2332; for slaked lime (Schondeling) P 2446.

Discoloration of Na salicylate soln. (Macadie) 1666; of toadstools (Ven. Arnhem.) 3269; of epinephrine-HCl (Elphinstone) 3327.

Diseases. Mikroskopie und Chemie am Krankenbett (Lenhartz, book) 91; K in cerebrospinal fluid in (Rosenbloom) 98; pituitary (Dunn) 333; purine metabolism in (Lindemann) 645; Ca metabolism in joint (Lindemann) 646; chem. basis of susceptibility towards (Quade) 1075; changes in voluntary muscles in general (Jewesbury) 1348; in Malaya rubber trees (Brooks) 1859; of metals (Kreuzpointer) 1893; ferment activity of blood in infectious (Falls) 1936; water and non-sp. (Morgan) 2410; refractometry of nerve fluid in (Babes) 3256; bacteria, of mouth and their relation to systemic (Stewart) 3291; serological analysis of serum sickness (Weil) 3293; influence of sickness of cattle on milk (Zaribnicky) 3294; see also *Infection* and the different organs, as *Kidney*, etc.

Disinfectants for porcelain (Mattes) P 136; gaseous (Hughes) P 259; colloidal Ag as germicide (Simpson) 640; fumigating-match (Lang) P 680; action of saponin on (Totky) 923; water-sol. (Schülke & Mayr) P 945; Hg compds. (Bayer & Co.) P 936; injury by, to seeds and roots in sandy soils (Hartley) 1086; (Schülke & Mayr A.-G.) P 1215; I as (Maben) 1343 (Mahon) 2101; (Halmann) P 1398; $(CH_3)_4N_4$ as, for urinary app. (Host) 1509, 1807; glycerol (Ruediger) 1929; practical use (Hasseltine) 2279; (Langer) P 2292; (Hamilton) 2414; alc. and I as (Comstock) 2661; activity of chrysarobin and medicaments used in psoriasis (Schamberg) 2672; electrolytic 2683; (Boyle) 2683; Grotan (Aumann) 2958; lime as sugar-factory germicide (Owen) 2991; $C_6H_4Cl_2$ as insect (Duckett) 3114; thigan (Frei) 3268; germicidal efficiency of dental cements (Poetschke) 3289; for destruction of fly larvae in horse manure (Cook) 1359, 3313; (Horovitz) P 3314; see also *Insecticides; Sprays; Soaps; Water, purification of.*

Disinfection, half-sp. (Bechhold) 93; of soils 231; steam and formalin, app. (Mayer) 344; influence of MeOH on, with CH_2O (Croner) 924; furnace for burning S for (Freiherr v. Walther, etc.) P 945; by compressed air (Deut. Desinfektionscentrale) P 945; app. (Niblett) P 1156; of clothing (Bordas) 1213; Manuel pratique de désinfection (Lhuillier, Belle, book) 1214; methods (Kropf) 1359; of excreta (Dreyfus) 1521; cyanide fumigation of ships (Roberts) 1523; of hides infected with anthrax spores (Tilley) 1554; in breweries (Moufang) 1823; plant of Fortress Cracow (Ebert) 1959; O_3 for, of air (Galli-Valerio) 1959; Der gegenwärtige Stand der Desinfektion im Rahmen der Seuchenbekämpfung (Grassberger, book) 1959; fumigating casks (Signoret) P 1960; fumigation with cresyl (Seidelin) 2118; *in vacuo* (Deut. Desinfektionzentrale) P 2279; of cadavers in war zones (Roubard) 2279; by HCHO (Lautenschläger) P 2415; (Boyle) 2683.

Disintegration, porosity and, of concrete 139; of blast furnace slag (Hochofen-, etc.) P 2420; of materials by fusion with Na_2O_2 (Nouillon) 2745.

Disintegrator for fibrous material (Stobie) P 1843.

Disks, grinding (Lundin) P 1102.

Dispersion, 2-dimensional (Schaefer) 15; of Cu sulfides from colloidal suspensions (Tolman) 44; of tetrahydro-2-naphthol and its esters (Kenyon) 293; "color-degree of dispersion law" (Voigt) 406; const. of quartz (Coblentz) 409; degree of, of milk (Wiegner) 668; of light in gases (Koch) 884; optical rotatory, in quartz (Lowry) 1003; rotation, of homolo-

Drugs, control (Linke) 121; revision of patent laws concerning (Thum) 128; legal protection during war (Magnus) 2285.

Drum, for treating bone black (Weinrich) P 258; for reducing metal oxides by H (Kayser) P 1297; closure (Anderson) P 2332.

Drying of waiting, 530; nitrates of soil and (Buddin) 832; beet leaves (Redlich) 943; bricks, 959; by H_2SO_4, $CaCl_2$ and Al_2O_3 (Marden) 1264; changes in potatoes during (Waterman) 1351 (Huitzinga) 3303; of linseed oil (Fritz) 1397; clay wares (Lovejoy) 1679, 2974, 3342; vapors from, paint (King) 1848; potatoes (Fischer) 2112; beet chips (Rose) 2158 (Janak) 3141; copra (Hines) 2820. *Patents:* (Besemfelder) 131; slime (Hencke) 133 (Techen) 874; gases (Claude) 238 (Leineert) 783; peat (Rigby) 369, 708 (Schwerin) 369 (Torfwerk Schülp) 859 (Adam) 2145 (Brune) 2306 (Jabs) 2449 (Rigby) 2811, 3126 (Wetcarbonizing, Ltd.) 2812; lignite (Rigby) 371; fruit (Harrison) 493; pretreated burner gases (Herreshoff) 522; sand, etc. (Coleman) 704, 1988; org. materials (Allen) 1098; peat, brown coal, etc. (Lambrecht) 1139; paper (Bauer) 1247; Cl gas (Aylsworth) 1262; garbage (Carr) 1360; cellulose articles (Bohumil Jirotka) 1391; glue (Grosvenor) 1672; $NaHSO_3$ crystals (Howard) 1672; air (Calcar) 1673, 2118; patent leather (Schulz) 1703; molds, cores, etc. (Böcking & Cie) 1896; art. stone or wet molds (Davidson) 2140; potatoes (Warth) 2160; celluloid (Grosvenor) 2313; hot air for (Buess) 2332; (Müller) 2435; peat, sea slimes, etc. (Meyer) 2472; grain (Chrzanowski) 2556; wood fiber (Schaanning) 2591; china-clay (Gee) 2702; natural gas (Roberts) 2706; copra (Annison) 3108; green malt (Schulze) 3116; compressed air or gases (Soc. l'Air Liquide) 3336; see also *Blast; Dehydration.*

Drying apparatus, acid-proof chamber (Weissenberger) 1; Walker gas-heating barrel, 166; for Pb products (Macklind) 236; (Bühler) 1261; for H_2SO_4 (Berkeley) 1569; in explosives ind. (Schweizer) 1844; refractories for, of sugar factories (Richter) 3341. *Patents:* For milk, etc. (Mick) 111 (McIntire) 338; for bone black (Weinrich) 258; for pulp (Sherwin-Williams) 398; oven (Ridge) 594; for paper, etc. (Coe) 714; vacuum (Passburg) 874; drum (Traurig-Eisenberg) 874; for clay (Stevenson) 959; for fine coal (Jahn) 962 (Baum, A.-G.) 2449; for animal waste matter (Meyer) 1084; (Elsworth) 1138; for steam (Ulrici) 1263 (Hombach) 2415; for starch (Jahn & Co.) 1407; for sewage (Ogden) 1524, 2414 (Bromet) 3314; for tar macadam (Taylor) 1680; for wool (Stone) 1695; for belting (Sibson) 1703; roll (Eisener) 1707; for fruits and vegetables (Textil.-Fabr.) 1813; trough (König, etc.) 2010; for vapors and gases (Züblin) 2010; (Simon) 2168; for tea, coffee, etc. (Davidson) 2275; for asphaltic oils (Bending) 2310; discharging (Müller) 2332; for ores, etc. (Witte) 2332; for bananas (Beth) 2408; for potatoes (Ferchland) 2408; for peat (Ford) 2585; (Rauls) 2586; for earthy substances (Popkess) 2703; for cereals (Löfquist) 2784 (Desaulles) 2999; for casting molds (Calow) 3218; for plates and wires (Rau) 3218.

Drying oils. See *Driers.*

Dry packs (Lucas) P 2291.

Dry-rot of wood (Wehmer) 1798.

Dry spot disease of oats (Krüger) 838.

Dry substance and resistance to winter of wheat (Sinz) 1346; fat in, of Ital. cheese (Fascetti) 2115; increase in fat-free, of milk from which fat has been removed (Tellera) 2674.

Ductility, effect of temp. on, of ingot Fe wires and of Cu wires (Lautz) 1166; increasing, of Fe or steel (Dismore) P 1880.

Dulcitol, test for (Mandel) 3081.

Dumas, Memoirs of (book) 885 (book) 886.

Dumortierite (Rimann) 577.

Duodenum, duodenal content analyses as index of disease and functional activity of pancreas (Crohn) 1639; acidity curves in (McClendon) 2937; enzymic power of contents of, as means of diagnosis of functional activity of pancreas (Crohn) 3098; exam. of contents (Lichten-

gan) 966; action of bleaching agents on natural (Taylor) 1120; effect of gas light on 1121; synoptical representation (Erban) 1249; Chem. of Org. Dye-Stuffs (Nietzki, book) 1251; and decompn. of fibers (Heermann) 1394; for Am. use (Norton) 1394, 2454; synthetic (Parker) 1394; Ger. coal-tar dye ind. (Redlich) 1394; and Coal-Tar Products (Beacall, *et al.*, book) 1549 (book) 1996; adsorption of, by colloidal clay (Rohland) 1567; manuf. in Russia 1693; war and coal-tar colors ind. (Pietrusky) 1693; and Austro-German patents (Dubosc) 1996; infra-red transmission and reflection of aniline dyes (Johnson) 2031; natural, and use 2151; aniline (Douglas) 2151 (Stone) 3363; European war and ind. of, in France (Lefevre) 2151; from Am. resources (Jacobs) 2286; natural (Chapin) 2314 (Srivastava) 2593; in U. S. and the war 2454; tree, of U. S. 2593; developing fast chrome brown on wool (Fort) 2594; for cotton (Hepburn) 2594; fastness to rubbing (Fort) 2594; behavior of kaolin toward (Rohland) 2701; manuf. (Wahl) 2710; native dye wood (Dunnington) 2815; identifying amido-H-acids (Hesse) 2815; in papermaking 2979; color-atlas (Ostwald) 2983; fastness of direct coppered blues (Edge) 2984; Chemistry of Coal-Tar (Fay, book) 2986; Analysis of Dyestuffs and their Identification in Various Materials (Green, book) 2986; use of flaming arc in testing (Mott) 3130; action of Grignard reagent on hydroxyketonic, and their ethers (Sirker) 3231; salvarsan (Schumacher) 3253; detection of coal-tar, in foods (Possetto) 3304; explosion at works 3362; fastness of, (Sirker) 3364. *Patents:* (Jordan) 154, 2596; (Kalle & Co.) 157, 2713; black (Farbw.) 157; rendering, cohesive (Anilin-Fab.) 385; aniline black (Vidal) 385; dischargable, on cotton (Eichwede) 720; (Tropp) 720; (Desamari) 722; red (Kunert) 864; wool (Sandoz) 865, 967; developing (Bayer & Co.) 967; (Schmidt) (Neelmeier) 1122; (Herzberg) 1123; (Kränzlein) 1846; developing, for cotton (Farbw.) 1124; dyeing with water-insol. (Wedekind & Co.) 1124; for skins, hair, feathers, etc. (Anilin-Fab.) 1124 (Erlenbach) 2315; black, for staining wood, etc. (Reissmann) 1398; Se (Frankel) 1847; basic (Cassella) 1847; stable conc. leuco salt mixts. of "hydro-blue" (Schmidt) 1997; leuco compds. of indigoid (Farbw.) 1998; as tanning agent (Marty) 2326; (Cassella & Co.) 2455; wool (Farbw.) 2456, 3133; alizarin (Schreiner) 2458; red wool (Weil) 2599; yellow wool (Bayer & Co.) 2599; black (Lederer) 2599; (Farbw.) 3132; blue wool (Kalle) 3368; see also *Coloring matter; Color(s): Hair; Pigments.*

Dyes, anthraquinone (Badische) P 1997 (Analin-Fab.) P 1998; wood (Anilin-Fab.) P 2152; see also *Dyes, vat.*

Dyes, arylaminoanthraquinone (Kränzlein) P 1694.

Dyes, azine (Riedel) P 865.

Dyes, azo, reserves among S and vat dyes (Heinzheimer) 528; production of, on fiber by naphthol AS (Ulrich) 1548; (Chichibabin) 1902; vital (Scott) 2391; bisulfite compds. of (Vorozhtzov) 2897. *Patents:* (Hagemann) 154, 864; (Zart) 154; (Bayer & Co.) 155, 385, 724, 865, 2152, 2597, 2598, 2697, 2713; disazo (Bayer & Co.) 156 (Farbw.) 156, 967, 2153; trisazo (Bayer & Co.) 156, 724, 2597; (Laska) 382, 2454; trisazo (Cassella & Co.) 383, 2455; (Griesheim-Elek.) 384, 1997, 2456, 2818, 3133; disazo (Griesheim-Elek.) 384, 2818; substantive green polyazo (Bayer & Co.) 386; (Zitscher) 529; yellow (Desamari) 721; blue trisazo (Blank) 721; (Herzberg) (Kothe) 722; (Reindel) 723; secondary disazo (Bayer & Co.) 724; (Jordan) 864; tetrakisazo (Sandoz) 966; substantive (Kalle & Co.) 966; contg. As (Farbw.) 1124; tetrakisazo (Levinstein) 1252; (Anilinfarben, etc.) 1395, 1695; red insol., on fiber (Farbw.) 1397; disazo (Levinstein) 1549, 2597; primary disazo (Chem. Works, etc.) 1550; primary trisazo (Chem. Works, etc.) 1550; primary tetrakisazo (Chem. Works, etc.) 1550; primary and secondary disazo (Anilinfarben-etc.) 1695; mordanting (Geigy) 1847; trisazo (Klingemann) 2712; (Wagner) 2712; (Günther) 2817; polyazo (Blank) 2817; (Levinstein) 3132; red wool (Wulff) 3365; mordant (Staehlin) 3336; mordant-dyeing (Mettler) 3366; (Farbw.) 3367; (Badische) 3367.

Dyes, gallocyanin (Farbw. Durand, H. & Co.) P 2597.

Dyes, indigo. See *Indigo; Thioindigo.*

Dyes, lake. See *Lakes.*

Dyes, pyrazolone, wool (Cassella & Co.) P 2456.

Dyes, pyrrole, new (Chelintsev) 3055.

Dyes, quinoline (Hamburger) P 155; (Chem. Fab. G.-E.) P 1847; (Farbw.) P 2455.

Dyes, quinonimide (Kehrmann) 318, 802, 1051.

Dyes, safranin, basic (Farbw. v. L. Durand, H. & Co.) P 2456.

Dyes, sulfine, yellow (Cassella & Co.) P 2818.

Dyes, sulfur, formation of H_2SO_4 from S (Zänker) 527; azo reserves among (Heinzheimer) 528. *Patents:* (Iljinsky) 529; brown (Grälert) 723 (Flachslaender) 1251; (Bayer & Co.) 865; (Farbw.) 865; blue (Schmidt) 1122; dyeing union goods with (Lodge) 1695; (Jaekel) 1846; (Vidal) 2455; (Anilin-Fab.) 2456; Bordeaux red (Weil) P 3368; see also *Dyes, vat.*

Dyes, thiazine, spectra of simplest (Kehrmann) 318.

Dyes, triarylmethane (Bayer & Co.) P 1997, 3367; (Gartner) P 2712.

Dyes, triphenylmethane, after-chromable (Farbw.) P 967, 1998; temp. coeffs. and effect

Digitized by Google

of acids, etc., on reaction velocities of (Biddle) 2092; bluish (Stock) P 2817.

Dyes, vat, azo reserves among (Heinzelmer) 528; progress in 1914 (Erban) 1548; catalytic reduction of (Brochet) 1602; fixing (Tagliani) 2594; app.-dyeing with (Münster) 2985. *Patents:* Anthracene (Schlegel) 382 (Kardos) 3369; blue (Münch) 529; yellow and brown (Isler) 722; (Drum) 722; printing pastes from (Carstens) 722; of anthracene series (Badische) P 724; of $C_{16}H_8$ series (Kardos) 966; of anthraquinone series (Kalle & Co.) P 967 (Badische) P 1999 (Bayer & Co.) P 1999; (Wedekind & Co.) 967; (Kalischer) 1123; (Kalle & Co.) 1124; (Wolff) 1251; tannin variegated etchings with (Kalle & Co. A.-G.) 1397; (Kardos) 1997; (Ges. f. chem. Ind., etc.) (Cassella & Co.) (Kalb) 1998; (Badische) 1998, 1999, 2316; (Farbw.) 2154, 2453, 2457, 2713, 3368; dark blue or black (Wray) 2315; benzanthrone (Badische) 2455; of indanthrene series (Steindorff) 2454; concd. vat preps. (Farbw.) 2455–6; benzanthrone (Badische) 2455; (Herdeu) 2596; (Thiess) 2818 (Cassella & Co.) 2818, 3368; black (Wray) 3366; bucking textiles dyed with (Bohn) 3666; see also *Dye, anthracene; Dye, anthraquinone; Dye, sulfur,* etc.

Dynamics, dynamical methods for detg. v. ps. (Campbell) 402; of polypeptide synthesis (Maillard) 1310; relativity theory (Tolman) 1562; action of foodstuffs (Lusk) 1631; of surfaces (Michaelis, book) 1713; "small vibrations" in atm. (Selliger) 2012; of isomeric change (Dawson) 2730; conception of org. individual (Child) 2903; of steel castings (Uhler) 3210.

Dynamite, sensitiveness of 1844; (Stine) P 2313; see also *Explosions; Explosives.*

Dynamo, alloy for, plates (Rübel) P 53, 1026, 1027.

Dynamo brushes, closing seams in C (Brown) P 269; (Whitney) P 269.

Dysentery toxin (Kirschbaum) 334.

Dyspnea, relation to blood reaction (Lewis) 1504.

Dysprosium, morphotropic relations of Et sulfates of, and other rare elements (Jaeger) 990.

Earth, thermal history of (Holmes) 1293, 2052; average Th content of earth's crust (Poole) 1430; age (Lindemann) (Stromeyer) 1736; symposium on (Chamberlin) 3197.

Earthworms, reactions to OH ions (Shohl) 484.

Ebonite, substitute (Damgaard) P 871; (Bayer and Co.) P 1860; uniting softer vulcanized rubber with powd. (Gare) P 2467.

Ebulliscopy, behavior of solvents at diff. pressures (Beckmann) 7, 746, 3011; chloral and bromal hydrates as solvents (Beckmann) 171.

Ebullition. See *Boiling.*

Echinodermata, chemistry of (Kossel) 2947; inorg. constituents of (Clarke) 1023.

Economizers, Their Heating Power and Efficiency (Smith, book) 1241.

Ectoprotease of grapes (Marras) 2773.

Edema, by toxic agents (Hess) 334; production after feeding salts (Tachau) 646; bicarbonate, in diabetics (Labbe) 652; chloride retention, acidosis and (Fischer) 821, 3095; from $NaHCO_3$ (Levison) 825; (Palmer) 1195; and Nephritis (Fischer, book) 1805; functional, in frog muscle (Back) 2264; cerebral (Dunn) 3290: exptl., in frogs (Moore) 3291.

Education, for research (Walker) 260; teaching and research (Cockerell) 260; of chemist and chem. engineer (Marion) 955; teaching of analytical chem. (Chapman) 1441; training of food chemists (Juckenack) 1945; of ind. chemist (Caven) (Prideaux) 1976; scientific organization (Hele-Shaw) 2970; tech. school research (Burnie) 2971; paper-making courses at Univ. of Mich. (Rue) 2979; school of paper-making at Grenoble (Barbillion) 3219; chemistry in high school (Bradbury) 2999.

Efflorescence, cures for 700; and spots of burnt earths 1678; prevention of, in finished brickwork (Williams) 3341.

Effluents. See *Waste.*

Egg albumen, in baking powder (Jackson) 226; rotation, adsorption and centrifugalization of (Rakuzin) 1488; protein of (Bokorny) 2907; see also *Albumin.*

Eggs, compn. before and after incubation (Dröge) 97; treating, with HClO (Fox) P 110; preserving (Coleman) P 227 (Dreher) P 493 (Vail) P 1832 (Cordes) P 2275; preserving, batter (Keith) P 227; Fe in respiration of sea urchin (Warburg) 487; poisoning from duck (Carles) 665; development of sea urchin (Warburg) 938; entrance of spermatozoön into (Loeb) 938; examg. (Engelhardt) P 1206; idiosyncrasy to, protein (Bronfenbrenner) 1505; fertilization membrane of echinoderm (McClendon) 1513; desiccating (Merrell) P 1516, 1952; cholesterol metabolism during incubation (Mueller) 1802; oxidations in, of sea urchin (Loeb) 1943; cholesterol of egg fat (Berg) 1946; formation of fats from proteins in (McClendon) 2403; conditions of activation of unfertilized starfish (Lillie) 2404; coating (Strauss) P 2556; preservation of life of frog (McClendon) 2780; accelerative action of irradiation on (Haecker) 3102; dextrose content (Pennington) 3107; effect of pituitary substance on, production (Clark) 3281; effect of CO_2 on, of *Ascaris* (Painter) 3303.

Egg white. See *Egg albumen.*

Egg yolks, extn. with acetone (Fendler) P 2291.

Ehrlich-Hata preparation. See *Salvarsan.*

Eichloff's flask, modification (Barthel) 2115.

Einstein's theory, of gravity (Lorentz) 2029.

Einthoven galvanometer (Apthorpe) 3.

Elaeolite, syenite laccolith (Kaiser) 2634.

Elaeostearic acid, linseed oil treated with Mn, Co and Pb salt of (Wise) 970.

Digitized by Google

Elarson, detg. As in organs and organic fluids (Joachimoglu) 661.

Elasticity, of ice (Koch) 8; modulus of, of metals and temp. (Lea) 285; flexure of cast Fe (Ono) 1596; of metals (Thompson) 2215; of mild steel wire (Dodge) 2370; bearing metal of high, 2757.

Electrical action, of mol. forces (Lenard) 2174.

Electric arc, formation of N oxides in (Schönherr) P 26 (Hene) 23 (Koch) P 27 (Roselier) 2737; flaming arc in steel ind. (Baldwin) 268; luminous vapors distd. from (Strutt) 550; flaming arc carbons (Moore) 757, 1433; arc phenomena and design of circuit breakers (Randall) 759; rotating (Foss) P 1156; effect of pressure on, spectra (Duffield) 1872; ilmenite (Ladoff) 2034; avoiding arcing in interrupters (Burstyn) 2190; pole effects in Fe (St. John) 2481; phenomena (Collis) 2839; flaming arc in paint and dye testing (Mott) 3130; arcing characteristics of air break switches (Bennett) 3174; see also *Electrode; Lighting, electric (arc lights); Welding.*

Electric battery. See *Cells, voltaic.*

Electric charge, detg. electronic (King) 13; and limiting value for colloids (Kruyt) 543; preventing static, in benzine containers (Lund-Lawerentz) P 711; in living cells (McClendon) 1488; detg. *Ne* for H (Eyring) 2182; of very small metallic particles in gases (Konstantinowsky) 2182; oil and metal particles in relation to (Zerner) 2030; detg. elementary (Lee) 2182 (Kunz) 2732.

Electric circuit, oil, breakers (Randall) 759 (Roth) 893.

Electric coils, insulating compn. for impregnating (Baekeland) P 3334.

Electric components, of series lines of H (Lunelund) 173.

Electric condenser (Preussman) P 759.

Electric conductivity. See *Conductivity, electric.*

Electric contacts. See *Contacts.*

Electric current, thermionic, in high vacua (Lilienfeld) 17; corona from d. c. circuits (Woodruff) 25; influence of c. ds. on adhesion of Ag deposits to high- Ni German silver (Mason) 1151; Alternating Electricity and its Application to Industry (Timbie, Higbie, book) 1154; corona loss curves (Peek) 1277; influence of a. c. on electrolysis by direct (Ghosh) 1431; high-tension test (Woodward) 1583; Manual with Directions for Testing (Bedell, Pierce, book) 1720; strong thermo- (Volkmann) 2025; mosaic glazing and (Huth) 2135; interrupting, and avoiding arcing at contacts (Burstyn) 2190; change of elasticity of mild steel wire with (Dodge) 2370; negative thermionic, from W (Smith) 2483; purifying liquids (Towne) P 2488; adjustment of d. c. lighting circuit to electroanalysis (Kauffman) 2853; a. c. and fermentation by yeast (Häggland) 2920; action of high frequency, on activity of pancreatic amylase (Punnett) 3072; contact electrification and (Sanford) 3173; relation between a. c. cond. of a dielec. and its change of capacity with frequency (Bairsto) 3174.

Electric cutout, for lamp circuits (Gilson) P 269.

Electric discharges, liberation of point, by ultraviolet light (Gerlach) 14; light emission of metal vapors in glow (Janicki) 15; production of Ne and He by (Collie) 20; potentials across short distances (Carter) 177; spectrum of oscillatory, in gases (Brunetti) 551; inertia of gas discharges (Lindemann) 749; chem. action of (Briner) 880; analysis of gases after passage of (Egerton) 1148; behavior of cane sugar under silent (Löb) 1490; silent, and enzyme reactions (Löb) 1490; active modification of N produced by (Strutt) 1561; force acting on cathode during glow (Tuczek) 2028; theory of glow (Holm) 2030; for wireless telegraphy and telephony (Langmuir) 2036; formation of colloidal solns. by (Donau) 2170; (Brown) 2348; chem. action (Briner) 2479; influence of silent, on mixts. of H and N (Le Blanc) 2479; action of silent, in O_3 formation (Lechner) 2737; oxidation of N by, in presence of O_3 (Ehrlich) 3029; photoelec. effect of metals under (Wertheimer) 3166.

Electric excitability, of liquid insulators (Holde) 879, 1389.

Electric field, action of, and magnetic field on red H line (Garbasso) 18; distribution of active deposit of Ra in (Walmsley) 20; relation between, and Stark effect (Wilson) 409 (Wislar) 882; alternating, and velocity of sound in gases (Küpper) 554; active deposit of Act in (Lucian) 555; effect on spectra (Stark) (Voigt) 882; in Hittorf-Crooks space (Lo Surdo) 1269; spectrum from Hg vapor in (Child) 1874; effect on emission lines of solids (Mendenhall) 2733; distribution of active deposit of Th in (Henderson) 2735.

Electric filaments. See *Lighting, electric filaments; Carbon; Tungsten.*

Electric furnace. See *Furnace, electric.*

Electric industries, Am., in 1914 (Martin) 412.

Electricity, passage between small contact distances (Rother) 15; voltage regulators (Gerrard) 25 (Schmidt) 562; effect of altitude on spark-over voltages (Peek) 268; quantities smaller than electron (Ehrenhaft) 411; treating beverages, oils, etc. (Henry) P 414; fundamental units (Smith) 556; elec. strength of air (Chubb) 758; Magnetism and (Richardson, book) 886; E. Weston's achievements in field of (Hering) 889; Cours d'électricité theorique (Pomey, book) 1009; insulating materials, high tension cutouts, magnetic properties, rectifiers, standard resistances (A. B.) 1141; in Gases (Townsend, book) 1147; importance of nations in elec. science (Auerbach) 1272; frictional (Jones)

Digitized by Google

1879, 2482; elementary quantum of (Zerner) 2030 (Konstantinowsky) 2182; waterfall (Lenard) 2174; deposition from flames by (Thieme) 2347; contributions of Julius Elster and Hans Geitel to knowledge of atm. (Bergwitz) 2486; eliminating fumes with, 2625; electro-metallurgical inds. as consumers of (Lyon) 2736; removing grease by (Brown) 2739; Elec. Nature of Matter and Radioactivity (Jones, book) 2838; influence on metabolism (Steel) 3101; Numerical Data of (Dutoit, Lewis, Mahlke, book) 3175; see also *Apparatus, electric.*

Electric mains, explosions in, 246.

Electric measurements (Smith, book) 265.

Electric nucleus, orbits of charged particle round (Hicks) 1580.

Electric oscillations, propagation through gases in expts. on cathode rays (Devik) 411.

Electric power, elec. furnace loads for, plants (Johnson) 22; off-peak loads and elec. furnace (Johnson) 22; rates (Harrison) 176; in Norway (Nissen) 754; industry (Rushmore) 1719; Standard Wiring for (Cushing, book) 1720.

Electric properties, of insulators (Schwaiger) 561; of Se (Brown) 1424; of Flames and of Incandescent Solids (Wilson, book) 1428; Ueber die thermoelektrischen Eigenschaften des Silicums (Baerwind, book) 1874; thermo-, of C (Moore) 2621.

Electric resistance of pure Fe (Burgess) 194; measuring liquid (Bräuer) 397; of Pt (Foote) 404, 2348; carborundum shunt, for series incandescent lighting systems (Prietze) 561; magnetic change in, at low temps. (Onnes) 735; of Hg and temp. (Jaeger) 749; at high temps. (Hering) 758; inserting, wire in heating elements (Katz) P 761; change of, in liquid He in magnetic fields (Onnes) 879; of Hg, Sn, Cd, constantan and manganin at low temps. (Onnes) 880; Onnes tests of, of metals at low temps. (Schüler) 997; of metals at low temps. (Schimank) 1144; of Hg at low temps. (Onnes) 1580; of electrolytes (Smith) 1869; recovery of, of Se following illumination (Brown) 2027; of AcOH (Johnstone) 2337; magnetostriction and, of Fe and Ni (Heaps) 2484; measurements on thin Pt films (Pogány) 2621; of sheet in magnetic field (Corbino) 2835; variation of, of Bi in magnetic field (Trabacchi) 2835; of Pt, Cu and Pb wires (Henning) 3148; normal (Fassbender) 3149; of subterranean waters (Pierl) 3191; influence of exposure on (Wilson) 3207.

Electric resistors, lab. (Noertemann) 3; for large currents (Van Name) 3 (Anon.) 414; charging, for electrolytic lightning arresters (Dill) 24; elec. furnace (Weintraub) P 28; (Maley) P 28; (Bastian) P 760; (Allgem. Elektrizitäts-G.) (Gebr. Siemens & Co.) P 1880; products (Elektro-Osmose, etc.) P 517; lining metal (Bradley) P 562; "silit" (L. B.) 892 (Gebr. Siemens & Co.) P 2192; variable, for radioactive measurements (Siegbahn) 1717.

Electric spark, ignition of gases by condenser discharge (Thornton) 525; on Röntgen tubes (Winawer) 552; potentials in gases at high pressures (Hayashi) 999; ultraviolet rays from oscillating, in water purification (Kawalski) 2954; dissociation of I vapor by (Kropp) 3019; (Sawtelle) 3023.

Electric wave, variation of Stark effect with wave length (Wilsar) 409.

Electrification by X-rays (Bedreag) 19; contact, and elec. current (Sanford) 3173.

Electroanalysis, micro- (Riesenfeld) 2199; adjustment of direct elec. lighting current to (Kauffman) 2853; development in Am. (Smith) 3040; Cu cathode in (Carrancio) 3186; see also *Copper, analysis,* etc.

Electrocardiography, T wave of human electrocardiogram (Cohn) 2109; electrocardiograph (Kahn) 3267.

Electrochemistry and chem. ind. (Foerster) 22; (Hale) 266; evaporator and power problem in, plants (Mantius) 268; Lab. Course in (Watts, book) 269; in 1914 (Roeber) 412 (Brandt) 1272 (Gutbier) 1435; Applied (Burgess, Cravens, book) 414; reactions at gas-liquid boundary of electrolytes (Haber) 1000; Elektrochemie (Ferchland, book) 1009; Alternating Current Electricity and its Application to Ind. (Timibe, Higbee, book) 1154; of Po (Hevesy) 1271; Pacific coast possibilities (Myers) 1272 (Beckman) 2838; potentiometrical arrangement for (Scarpa) 1558; of Non-Aq. Solns. (McBain, book) 1720; progress of industrial (Arndt) 1718; metallurgical ind. (Foerster) 2736; Elektrochemie wässeriger Lösungen (Foerster, book) 2840; Lehrbuch der Elektrochemie (Arrhenius, book) 2840; Am. Electrochem. Society in its external relations (Lidbury) 3028; Numerical Data of (Dutoit, Lewis, Mahlke, book) 3175; see also *Electrolysis; Electrolysis, industrial.*

Electroculture (Löb) 231; (Hosmer) 501; (Peaslee) 686; (Hombérger) 1218; (Bromberg) 1219; (Löb) 1490; see also *Electricity.*

Electrodeposition of Fe (Soc. "Le Fer") P 30 (Cowper-Coles) P 759; of Pb (Mathers) 267, 1275; of Sn (Mathers) 267 (Battle) P 3177; of metals (Tainton) P 414 (Hybinette) P 1011; of Cu (Perreur-Lloyd) P 761 (Hybinette) P 1012; in presence of org. bases (Mazzucchelli) 1719; of Zn, Co (Larson) P 1880; from flames (Thieme) 2347; of Ni (Bennett) 3031; of Zn on surface of solns. (Titov) 3031; lighting of electrolytic tank rooms (Harrington) 3032; cleaning and plating in same bath (Watts) 3032; see also *Electrolysis; Electroplating; Galvanising,* etc.

Electrodeposits, stripping of metal (Jones) 560; nickeled (Barham) 756; detg. wt. of (Wilson)

Digitized by Google

756, 2492; pyrophoric cathodic (Kremann) 1152.

Electrodes, photoelec. measurements with oxidized Cu (Goldmann) 14; light from unconsumed (Vosmaer) 25; potentials in mixed solvents (Pearce) 172; flaming arc (Hatfield) 176 (Moore) 757, 1433; reproducibility of Cu (Getman) 267; effect of magnetism of, on e. m. f. (Elias) 880; movable, 890; and diffusion potentials (Moffitt) 997; dropping, in alc. solns. (Newbery) 1000; absorption of H by Na-K (Gowdy) 1419; e. m. fs. in alc.—combinations of H and calomel (Furness) 1423; Manuf. of Elec. Arc Carbons (book) 1433; reproducibility of Cd (Getman) 1582; H (Barendrecht) 1627 (McClendon) 2915; org. bases and potential of H (Mazzucchelli) 2026; electron emission of a CaO, in vacuum (Germershausen) 2028; strip (Göckel) 2487; potential of Rb (Lewis) 2615; charged surface layers on, of vacuum tubes (Compton) 2732; status of arc lamp carbons (Clarke) 2739; e. m. fs. due to simultaneous movement of, and electrolyte (Procopiu) 3012. *Patents:* arc light (Walker) (Ayrton) 26 (Dempster) 28 (Schott & Gen. Glaswerk) 270, 1281 (Baldwin) (Lewis) 759 (Conradty) 760 (Hagen) 894 (Ver. Chem. Fab., etc.) 1156 (Mott) 1278, 2352 (Little) 1584, 2488 (Carbone) 2192 (Gebr. Siemens & Co.) 2193 (Hill) 3034 (Abbott) (Krueger) 3176; furnace (Seabury) 26; prepg., for use in welding metals (Kjellberg) 26; storage battery (Edison) 26 (Hancock) 1278 (Chamberlin) 1434 (Luthy) 1879 (Howard) 3176; of Mn cells (Burger) 29; for Pb accumulators (Ligneris) 29 (Hancock) 270 (Dinin) 3177; washing and pickling storage battery plates (Engel) 414; packing, of storage batteries (Krannichfeldt) 759; negative C (Ayrton) 760; Cu oxide (Mello) 762; protecting, of elec. arc furnaces (Bronn) 1009; for gas-purifying app. or O_2 generators (Steere) 1011; for O_2 generators (Knox) 1011; negative, for primary batteries (Tassin) 1011 (Schoenmehl) 1721; for animal organisms (Luckow) 1070; for electrolytic cells (Parks) 1154; cooling device for, of vacuum tubes (Grisson) 1156; for vacuum tubes (Schröter) 1156; holder for C (Planiawerke, etc.) 1156; graphitizing (Brown) 1277; for search lights (Siemens & Co.) 1281; protecting, of furnace (Bronn) 1585; regenerating NiO (Svenska Ackumulator, etc.) 1585; for alk. accumulators (Morrison) 1585 (Svenska Ackumulator, etc.) 1585, 1721 (Lübeck) 2354; cooling Röntgen tube (Reiniger, etc.) 1877; battery carbons (Johnson) 1879; of molten Fe oxide (Laszczynski) 1880; core paste for arc-light (Ver. Chem. Fab., etc.) 2038; burning C (Mendheim) 2192; C, for flaming arc lamps (Allgem. Elektrizitats-G.) 2192; MnO_2 (Siemens & Halske, A.-G.) 2193; C (Sommerfeld) 2193 (Brown) 3176; for flaming arcs (Mott) (Perris) 2488; regulating position in elec. furnaces (White) 2625; for metallurgical furnaces, etc. (Favier) 2626; uniform burning away of, of arc lamps (Körting) 3178; see also *Anodes; Cathodes.*

Electrodynamics, electron theory and, of moving bodies (Born) 1580.

Electro-filtros (Thatcher) 1877.

Electrolysis, hoist control (Cullinan) 24; flames (Bancroft) 404; of rare earths (Dennis) 560; its detection and mitigation (McCollum) 757; prevention of Pb poisoning (Goadby) (Oxley) 824; electrolytic processes at diaphragms (Albrecht) 992 (Bethe) 1870; of fused borates (Zschille-Hartmann) 1007; of $SbCl_3$ in presence of colloids (Mazzucchelli) 1008; of Na hydrazide in anhydrous N_2H_4 (Welsh) 1015; in gas and water mains (Yerbury) 1153, 1432; of org. compds. (Blaschke) 1275; cinematographs of, 1276; prep. of Mg (Frary) 1285; at. wt. of Cu by (Shrimpton) 1412; of glass (Speranskii) 1419; influence of a. c. on, by direct current (Ghosh) 1431; formation of alloys by (Bruni) 1432; formation of aromatic hydrocarbons by (Schall) 1583; preventing in concrete structures (Gardner) 1848; detg. electrolytic transportation of water (Remy) 1869; preventing corrosion from, 1878; electrolytic reduction of quinoline alkaloids (Bredenberg) 2243; theory of (Schellenberg) 2479; Hg electrolytic meters (Boesom) 2487; overhead, and porcelain strain insulators (Foster) 2624; of solns. of rare earths (Dennis) 2738; mitigation, Manitoba, 2739; detn. of biol. soil soln. (Pantanelli) 2787; relation between electrolytic and chem. processes (Reichinstein) 3019; treatment of septic wounds by (Fowler) 3302; see also *Corrosion; Decomposition; Dissociation; Electric current.*

Electrolysis, industrial, Fe manuf. by (Guillet) 756; acid dip installation (Perls) 890; working up of materials obtained by, of residual liquors from manuf. of potash salts (Dietz) 1582; of sewage (Schneckenberg) 2411; refining Sb (Betts) 2838; development of electrolytic Cu refining ind. in U. S. (Francke) 3171; of $CuSO_4$ liquors (Addicks) 3172. *Patents:* Cell for producing O and H (Griffin) 27 (Soc. anon. l'oxhydrique, etc.) 564 (Burdett) 3034; of alkali chlorides (McDonald) 28 (Gaus) 563 (Hoesch & Co.) 1157, 1281 (Ochs) 1584 (Allen) 2488 (Ges. für Chem. Ind.) 3178; of alkali halides (Siemens) 270; reinforced concrete cell for, of NaCl (Statham) 563; cleaning by (Hotchkiss) 564 (Couch) 893; of water (Strohmenger) 759 (Landreth) 2191; of salt solns. (Soc. anon. Balè) 761 (James) 2741; purifying liquids by (Browne) 894; forming Cu-Ni anodes for electrolytic sepn. (Hybinette) 1009; sepg. Cu and Ni from mat (Hybinette) 1009; electrolytic recovery of Cu (Hybinette) 1013, 1434, 2037; (Niblett) 1154; (Jenkins) 1155; of fused caustic alkali (Ashcroft) 1155; bleaching, disinfecting or preserving articles by mean-

Digitized by Google

of gases produced by (Niblett) 1156; of alkali metals (MacNitt) 1280; app. for purifying sewage (Craney) 1360; of metallic compds. (McNitt) 1585; generating Cl by (Werner) 1585; cleaning and removing tarnish from metals (Keyt) 1721; (Hybinette) 2193; purifying foods by (Goucher) 2408; of water or sewage (Landreth) 2414; refining metals (Pyne) 2488; of alk. earth and alkali metal salts (Nelson) 2625; (Dawe) 2626; (Ashcroft) 2742; production of metals (Hanriot) 2840; electrolytic app. for producing gases (Goddard) 3034; electrolyzing acid $NiSO_4$ soln. (Hybinette) 3035; of sulfite ores (Wagner) 3177.

Electrolytes, control of phys. conditions in (Rojas) 24; impurities in, of Pb storage battery (Weightman) 268; diffusion of, in gelatin (Vanzetti) 406; and oil–water systems (Clowes) 464; current-potential of (Kruyt) 543; inclusion in Ag voltameter (Richards) 559; influence on p. d. at oil-water and glass-water boundary (Powis) 737; (Marino) P 761; elec. cond. of, in org. solvents (Pearce) 992; electrochem. reactions at gas-liquid boundary of (Haber) 1000; photo-active cells with fluorescent (Thompson) 1002; pptn. of colloidal mastic solns. by mixt. of (Bender) 1142; thickening, for alk. elements (Achenbach) P 1157, 1880, 2742; hydrodiffusion of (Smith) 1266; conds., dissocns. and viscosities of solns. of (Jones) 1269; photochem. evolution of (Boll) 1270; coagulation of albumin by (Bancroft) 1339, 1788; conc. of, of sea-water and rate of nerve-conduction in *Cassiopea* (Mayer) 1349; coagulation and peptization of albumin sols by means of suspension colloids in solns. contg. (Brossa) 1415; for primary cells (Manchester) P 1583; for Pb-Zn storage batteries (Hurley) P 1584; osmotic pressure and conc. in solns. of—degree of dissoc. (Bates) 1710; action on *Avena sativa* (Plate) 1799; influence of colloidal S on f. p. of aq. solns. of (Raffo) 1868; resistance of (Smith) 1869; for production of Na (Acker) P 1880; action on effluents contg. org. waste (Rohland) 1957; dissoc. as a function of the neutral mol. (Szyszkowski) 2014; solubility in salt solns. (Szyszkowski) 2015; cond. and ionization of, in abs. EtOH (Robertson) 2018; distribution of, between solvents (Creighton) 2175; thermochem. significance of coeff. "δ" in $PV = iRT$ (Bogorodskii) 2178; condition of dissolved (Snethlage) 2341, 3011; in germinating seeds (Dezani) 2396; removing As from H_2SO_4 and $CuSO_4$ (Martin) P 2488; coagulation of As_2S_3 sol by (Mukhopadhyaya) 2616; purification of (Pyne) 2624; doubling of Raoult effect in dil. solns. of (Kohl) 2728; e. m. fs. due to simultaneous movement of electrode and (Procopiu) 3012; influence on dissociating power of solvents (Sakhanov) 3014; physiol. properties (Bouglovanni) 3100; for deposition of Sn (Battle) P 3177.

Electrolytic dissociation. See *Dissociation.*

Electrolytic refining. See *Electrolysis, industrial; Copper, metallurgy of*, etc.

Electrolyzer, Schmidt, 2190.

Electromagnetic waves, in perfectly conducting tube (Silberstein) 881; diffraction of, by crystal (Bragg) 1579.

Electromechanical properties of Se (Brown) 1424.

Electrometallurgy (Mackay C. P. Co.) P 762; ind. (Foerster) 2736; as consumer of elec. power (Lyon) 2736; see also *Furnace, electric; Iron, metallurgy of*, etc.

Electrometer (Curtis) 257; for radioactive investigations (Folmer) 887; e. m. fs. in alc. by (Newbery) 2476; condenser for (Clark) 2485; (Parsons) 2826.

Electromotive force. See *Potential, electric.*

Electronics, of conjugated reactions (Dain) 1864; see also *Electrons.*

Electrons, detg. charge on (King) 13; atm. of metal (Rother) 15; emission in chem. reactions (Haber) 404 (Just) 1139 (Tanatar) 3015; quantities of electricity smaller than (Ehrenhaft) 411; mass of (Neumann) 555; Lorentz (Schott) 753; no. of free, in non-magnetic metals (Otashiro) 881; permanent orbits and origin of spectral series (Walker) 881; Stark-Lo Surdo phenomenon (Garbasso) 998; thermionic current (Eve) 1711; from metal foils under Röntgen radiation (Hoepner) 1715; emission from glowing bodies (Horton) 2028; emission of CaO electrode in vacuum (Germershausen) 2028; distribution in atoms (Compton) (Bragg) 2034; discharge for wireless telegraphy and telephony (Langmuir) 2036; consts. (Allen) 2337; "electronic transfer" (Northrup) 2347; emission of metals (Schottky) 2348; pure discharge (Brown) 2348; in metallic conduction (Livens) 2482; energy of moving (Page) 2483; and heat (Richardson) 2620; ionization and radiation of gas mols. due to collisions with (Nesturch) 2730; thermionic emission (Richardson) 3166; see also *Electronics.*

Electron theory, Maxwell-Lorentz equations for (Byk) 552; stereoisomerism and (Pauly) 598; of valence—inorg. compds. (Nelson) 874; and distribution of gas mols. in field of force (Richardson) 881; of elec. cond. in metals (Minton) (Livens) 881, 1576, 2733 (Richardson) 2733; absorption spectra of org. substances and (McClelland) 882; and various phenomena (Minton) 1263; of valence (Brunel) 1263 (Falk) 2172; and electromagnetic radiation (Minton) 1579; and electrodynamics of moving bodies (Born) 1580; of optical properties of metals (Livens) 1871, 3021; electronic conception of positive and negative valences (Fry) 2826; of Matter (Richardson, book) 2836; see also *Valence.*

Electro-optics of H mol. (Heydweiller) 2347.

Electro-osmosis (K. A.) 134; dehydration

Digitized by Google

(Elektro-Osmose) P 894; (Illig) P 1278; see also *Osmosis*.

Electroplate, Cu, in case-hardening (Paxton) 906.

Electroplating, with brass (Riley) 24; (Sprague, book) 26; wire (Gibbs) P 179 (Herrmann) P 2354; prepg. Al for (Canac geb. Quentin) P 292 (L'aluminium français) P 1280 (Roux) P 2191 (Hall) P 2488; in 1913 (Neukam) 557; electrolytic Ni solns. (Rowsbar) 558; chem. reactions in (Ottman) 756, stereotypes (Barham) 756; bright deposits (Proctor) 890; Pt plating (Nicolaus) 890, 2037; prepg. non-metallic surfaces for (Waltispurger) P 1012; advance of ind. (Dittmar) 1151; control of brass and Cu, solns. (Cowperthwait) 1151; Cu cyanide solns. (Weber) 1151; with Cu (Cowper-Coles) P 1155; alloy for solns. (Gleason) P 1170; with Co (Kalmus) 1431 (Buchanan) 2739; single cell Au (McAloon) 1582; Ni-plated Al (Canac) 1583; non-metallic articles (Mills) P 2191; Au and Pt (Kateridge) 2738; lead-plating baths (Mathers) 2739; Ni, on Zn (Weber) 2739; plant (Grupp) 2739; of troublesome die-castings (Herrick) 2839; with Ni (Bennett) 3031; see also *Electrodeposition; Galvanisation*.

Electroscope, interchangeable (Liud) 1714; Zeleny (Horton) 2997.

Electrostatic charges, position of (Lenard) 2174.

Electrotechnics, Lehrbuch des Elektrotechnik (Thomälen, book) 893; Se in (Meissner) 891; Die Elektrotechnik (Laudien, book) 1009.

Electrotyping in 1913 (Neukam) 557; regulation of, solns., 1152; (Huth) 2190; see also *Electrodeposition*.

Element, galvanic. See *Cells, voltaic*.

Elements, Die Atomionen chem. Elemente und ihre Kanalstrahlen-Spektra (Stark, book) 19; ordinals or at. numbers (Broek) 22; isotopic (Hevesy) 175, 1271, 2485 (Fajans) 1149; representation by points in space (Piutti) 399; no. relations among (Loring) 875; transformation of (Jorissen) 886; synthetic system of (Hackh) 1140; high-frequency spectra of (Malmer) 1144; long-lived member of Bi pleiad (Fajans) 1147; new, in Pt minerals of Urals (Cerdan) 1266; evolution of (Loring) 1413, 1708 (Rutherford) 2473; photochemistry of rarer (Benrath) 1723; compressibilities (Richards) 2011; relation between the phys. quantities c, β, δ and E for solid (Kleiber) 2024; standard wts. for (Waddell) 2613; modification of periodic system (Bilecki) 2999; secondary periodicity (Biron) 3000; periodic system and periodicity in properties (Vosmaer) 3147; heat of fusion and periodic system (Carranelo) 3148; influence of diff., on corrosion of Fe (Wilson) 3212; see also *Periodic system; Radioelements*.

Elimiton (Puckner) 2129

Ellagic acid, from galliyigiycine (Nierenstein) 2919.

Elsholtzia cristata, oil of (Asahina) 1048, 2088.

Elsholtzia ketone and derivs. (Asahina) 1048.

Elsholtzic acid and derivs. (Asahina) 1049, 2088.

Emanations, effect of edges of metal foil on transparency to radioactive (Imhof) 552; charging water with (Bamberger) P 1150; influence of radioactive, on yeasts and alc. fermentation (Jacquemin) 1221; at. wts. of radioactive (Debierne) 1428; radioactive (Debierne) 1428; condensation of Th (Fleck) 1429; see also *Radium emanation*.

Embossing, fabrics (Wilkinson) P 864; metallic dies for (Bardsley) P 3335.

Embryos, intracellular digestion and assimilation in amphibian (Coghill) 3102; action of Et_2O and Ra or Röntgen rays on (Haecker) 3102; effect of KI, methylene blue and other substances on, sacs of seed-plants (MacDougal) 3271.

Emesis, seat of emetic action of drugs (Eggleston) 3298.

Emetine (Wellcome) P 126, 356; history of (Prinz) 3328.

Emetine bismuth iodide, in treatment of entamebiasis (Du Mez) 2567.

Emetine hydrochloride as an amebicide and hemostatic (Stewart) 2969; and psoriasis (Chaplin) 3299.

Emetine mercuric iodide in treatment of entamebiasis (Du Mez) 2567.

Emigration quarters of Hamburg Am. Line (Endris) 1958.

Emission of enhanced lines in H atm. (King) 15; light, of metal vapors in glow discharge (Janicki) 15, 3150; Sagnac effect and, theory (Witte) 17; of electrons in chem. reactions (Haber) 404 (Just) 1139 (Tanatar) 3015; demonstrating, of light (Gehrcke) 1145; thermionic (Hopwood) 1425; electron, of CaO electrode in vacuum (Germershausen) 2028; conditions for band spectra of N and C (Seeliger) 2030; law for homogeneous X-rays (Laub) 2033; of gas residues in Röntgen tubes and, of X-rays (Cardani) 2188; electron, of metals (Schottky) 2348; of spectrum lines (Ladenburg) 2621; see also *Radiation*.

Emission spectra. See *Spectrum*.

Emissivity of metals and oxides (Burgess) 13, 404 (Foote) 2348; of Pt (Foote) 404.

Empressite (Schaller) 42.

Emptying device for superphosphate dens (Bakema) P 1654; for filter (McNutt) 2997; for centrifuges (Eberhardt) 3146.

Emscher tanks, Erfurt (Strassburger) 2958.

Emulsification, theory of (Bancroft) 1567, 2171; (Donnan) 1869; and detergent action (Shorter) 2603.

Emulsin, synthesis of a glucoside by means of (Bourquelot) 1309, 1923; glucosidificatior

Digitized by Google

of glycerol by (Bourquelot) 2521; (Bokorny) 2907.

Emulsions, mixing (Schröder) P 5; estn. of cod liver oil in (Buemming) 121; breaking up, of petroleum oil and water (Laird) P 147, 1994; for margarine (Schou) P 493; destroying (Meyn) P 731; relations between stability of oil, and p. d. at oil-water boundary and coagulation of colloidal suspensions (Powis) 737; electrolytes and p. d. at oil-water boundary of oil (Powis) 737; oil (Ellis) 737; detg. cod liver oil in (Zölfl) 845; sepg. constituents of (Meyn) P 1134; manuf. (Blichfeldt) P 1229, photographic (Christensen) P 1282; adsorption of soap in C_6H_6-H_2O interface (Briggs) 1414; (Donnan) 1869; app. for making (Silkeborg, etc.) P 2010; (Briggs) 2171; water-miscible, for use in lubricants, etc. (Bückel) P 2323; cooling hot or molten (Naamlooze, etc.) P 2821.

Emulsoids, reversible transformation of, solns. into suspensoids (Scarpa) 7.

Enamelling, metals (Deleuil) P 137 (Hirsch) P 2580; muffle-furnace for (Zahn) P 701; cleaning metals for (Davidson) P 1104; metals (Honigmann) P 1540; elec., ovens 2974.

Enamels, Raw Materials for, Ind. (Grünwald, book) 519; Fe, applied dry (Kraze) 957; luminous (Crivelli) 1253; saltpeter replacement in, ind. (Tostmann) (Kraze) 3341. *Patents:* opaquing-agents for (Weiss) 136 (Ver. Chem. Fab. etc.) 363 (Kreidl) 136, 701, 1103, 2701 (Weber) 2701; for metals (Vollrath) 239; decorating enamelled metals (Haschek) 852; white (Kreidl) 1103 (Ver. Chem. Fab., etc.) 2579; (Aylsworth) 1696; (Intern. Color & Chem. Co.) 2001; Fe (Ver. Chem. Fab., etc.) 2301; white pigment (Rickmann) 2444; designs on (Seiter) 2579; (Baezner) 3343.

Enanthaldehyde, 4,4'-diphenylsemicarbazone (Toschi) 2388.

Enanthole. See *Enanthaldehyde*.

Enantiomorphism of mol. and crystal structure (Barlow) 2473.

Enantiotropy, metastable continuation of fusion line and mixed crystal line and (Smits) 1423.

"Endlaugenkalk" (Ehrenberg) 948.

Endoagar, regeneration of used (Mohorcic) 3260.

Endosmosis. See *Osmosis*.

Endothelium, lipoids of (Tait) 1934.

End-piece. See *Complement*.

End-points, critical, and system C_2H_6–$C_{10}H_8$ (Prins) 1564.

Enemas, nutrient (Scheel) 2263.

Energesis and cancer (Bristol) 2667.

Energicos (Dassogno) 941.

Energy, recent views (Dushman) 5; rotational, of diatomic gas (Holm) 14; distribution of, in γ-rays (Szmidt) 20; chem., of combination (Brophy) 172; imparting, from one body of gas to another (Hart) P 398; free, of S (Lewis) 401; measurement of, quanta (Bjerrum) 408; deviations from Curie's law in connection with zero-point (Oosterhuis) 410; energy exchange of atrophic infant (Bahrdt) 647; temp. coeffs. of surface, of liquids (Jaeger) 738, 3010; radiant, and eye (Burge) 811; of photographic processes (Warburg) 883; free, of C compds. (Lewis) P 986; changes in binary systems (Kremann) 1143; equipartition hypothesis and gases in state of change of internal (Stewart) 1575; statistical relations of radiant (Livens) 1576; requirement of newborn (Bailey) 1632; transformation of, in domestic fowl (Gerhartz) 1633; values of feeding stuffs (Armsby) 1634; source of, of machines (Bodenstein) 1989; sp. surface, of alkali salts (Jaeger) 2024; sp. surface, of molten alkali halides (Jaeger) 2024; Planck-Einstein formula (Ratnowsky) 2029; distribution in radiation from uviol lamp (Allmand) 2185; exchange during photochem. processes in gases (Warburg) 2480; of moving electron (Page) 2483; free, of formation of HCO_2H (Branch) 2832; free, of N compds. (Lewis) 2832; of vol. and surface and physico-chem. properties of substances (Veimarn) 2832; Surface, and Its Influence on Chem. Phenomena (Willows, Hatschek, book) 2836; Ueber den Energieumsatz bei photochemischen Vorgängen in Gasen—Absorption ultravioletter Strahlung durch Sauerstoff (Warburg, book) 2836; changes in gases (Szell) 3021; Se in measurement of, of X-rays (Voltz) 3027; transmission by media of eye and glasses (Hartridge) 3069; transformations during horizontal walking (Benedict) 3087 (Benedict, Murschhauser, book) 3280; law of photochem. processes (Warburg) 3149.

Engine, High-Power Gas (Dubbel, book) 369; Gas, Gasoline and Oil- (Hiscox, book) 523; combustion of C_2H_6 in explosion (Terres) 856; utilization of exhaust-gas heat from internal-combustion, 1106; premature ignition in gas (Waldeck) 1240; fuels for internal-combustion (Watson) 1687; Diesel (Chalkley, book) 1839; blast furnace gas (Hubert) 2053; distribution of heat in cylinder of gas (Gibson) 2142; gas blowing, 2504; thermal efficiency of gas (Asakava) 3124; standard specifications for cylinders for locomotives, 3202; Internal-Combustion (Streeter, book) (Wimperis, book) 3357; Ueber den Dieselmotor, seine Erprobung und seine Treibmittel (Barth, book) 3357. *Patents:* removing C deposits from (Olin) 129 (Saxe) (Bule) 244 (Bundy) 708 (Price) 2705; fuel for internal-combustion (McArthur) 244 (Southey) 374 (Smith) 375 (Warth) 1245 (Jenkins) 2145 (Southey) 2148 (Hease) 2587 (Blieberger) 3353; carburetting agent for internal-combustion (Vincenti-Piobb) 522; for beating and refining paper pulp (Butts) 525; refining-, for paper stock (Meader) 714; internal-combustion (Heyl) 858; utiliz-

Digitized by Google

ing hot boiler oil of marine (Bauer) 2148; deodorizing waste gases from internal-combustion (Haas) 2309; lubricant for steam (Pettit) 2309; oils for internal-combustion (Constam) 2452.

Engineering, Chem. (Hinchley, book) 357 (Beilby) 2572; bibliography on training and education of chem. engineer (Marion) 955; status of the engineer (Stillwell) 1373; ideal engineering society (Lincoln) 1373; chem., in nitrocellulose manuf. (Stadelman) 2149; Dielec. Phenomena in High Voltage (Peek, book) 3034; expt. station of Univ. of Ill. (Paine) 3119; alloys in, construction (Webster) 3210; Numerical Data of, and Metallurgy (Archbutt, book) 3213.

Engraving, Schreiner (Laing) 3131.

Enidine, salts (Willstätter) 1306.

Enine, salts (Willstätter) 1305.

Enols, constitution (Scheiber) 301; chromoisomeric salts of (Hantzsch) 2243.

Enormophone, pharmacodynamic effects (Major) 1943.

Entameba, infections of nose and mouth (Howe) 3294; *E. buccalis* (Sturridge) 3300.

Entamebiasis, treatment of (DuMez) 2567.

Entrainment reactions in analysis (Meillère) 1726.

Entropy of vaporization (Hildebrand) 1423; const. of gases and liquids (Tetrode) 2020; in solid substances and its relation to other phys. quantities (Pagliani) 3016.

Enzyme action on thioacetaldehyde (Neuberg) 58; mode of (Van Slyke) 89, 90; sp. protective, in histological specimen (Rollett) 92; (Armstrong) 327; optimal temp. of (Compton) 327, 1185; in decomp. of glucose and mannitol by *B. coli communis* (Grey) 330; of *B. delbrücki* (Euler) 472; etherization and, of bulbs and tubers (McCool) 475; (Jobling) 482; X-rays and (Richards) 632; esterase and lipase of castor beans (Falk) 634; activity of blood-serum (Falls) 655 (Halsen) 656; H_2O_2 decomp. by (Waentig) 918; serum proteases and mechanism of Abderhalden reaction (Jobling) 920; (Prescott) 1068; reversibility of (Bourquelot) 1339; silent discharge and (Löb) 1490; at low temps. (Hepburn) 1920, 2906; lipase of soy beans (Falk) 1922; of blood in infectious diseases (Falls) 1936; action of enzymes of malt on insol. cell-substance of beet (Herzfeld) 1967; influence of capillary-active substances on (Chapman) 2097; poisons and (Santesson) 2097; tissue (Morse) 2768; abolishing parallelism between chymosin and pepsin action (Hammarsten) 2904; serum enzymes after feeding and during tryptic shock (Jobling) 2904; role of enzymes in chem. changes (Maryott) 2906; surface tension and (Beard) 3068 (Armstrong) (Cramer) (Brown) 3255; action on carbohydrates of yeast (Giaja) 3075; co-, of salts of α-keto-acids (Neuberg) 3076; influence on rat tumors of serum contg. enzymes sp. to those tumors (Abderhalden) 3090; mechanism of anaphylactic shock (Jobling) 3095; enzymic power of duodenal contents as means of diagnosis of functional activity of pancreas (Crohn) 3098; adsorption in (Bayliss) 3254; syntheses of polypeptides, peptones and proteins by (Abderhalden) 3258; test of activity (Paquin) 3265; atrophy and acceleration of tissue (Morse) 3293.

Enzymes, reducing endo-, in animal tissues (Harris) 89, 2659; demonstration of protective (Hirsch) 92; protective, against corn protein (Nitzescu) 98; Abderhalden's protective (Wegener) 98 (Brahm) 1488; of *A. oryzae*—in fermentation ind. (Takamine) 117; that decompose fat, lecithin and wax in organs (Porter) 212; of *Aspergillus terricola* (Scales) 330; in living yeast (Kullberg) 471; of *Fucus vesiculosus* (Duggar) 475; potato amylase (Doby) 476, 1190; of digitalis plant (Rapp) 508; detection of protective (Schenk) 654; digestive, and fish poison (Konstanov) 654; splitting of strophanthin by (Johannessohn) 663; of honey (Gothe) 666; starch-forming, from malt—action on hemicelluloses—application to brewing (Davis) 690; of mold fungi (Kylin) 809; oxidizing in plants (Pellegreffi) 815; enzyme therapy of diabetes mellitus (Schnee) 819; simultaneous change in content of glycogen, N and, in yeast (Salkowski) 921; casein-splitting (Kastan) 930; specificity of protective (Jaffé) 930, 2105; destruction of pancreatic, by heat (Lombroso) 1068; Abwehrfermente (Abderhalden, book) 1075; influence of X-rays and Ra Ems on "protective," of Abderhalden (Keitler) 1348; bacterial, that liquefy gelatin and their antienzymes (Bertiau) 1493; influence of H ion conc. on optimum temp. of (Compton) 1621; blood, in albumin and globulin fractions of serum (Satta) 1639; protective, of blood after transplantation of organs (Goodman) 1640; plant oxidation (Begemann) 1791; stability of yeast (Bau) 1823; oxidizing and reducing (Bach) 1919; production (Zikes) 1920; rate of oxidation of, and their corresponding pro- (Burge) 1920, 3257; of nervous system (English) 1922; production and activity of (Crabill) 1924; reactions of, in stomach (Pribram) 2097; inhibition (Lichtwitz) 2098; oxidizing (Chodat) 2099; in mycelia of *Penicillium glaucum* (Franceschelli) 2101; plant (Hall) 2102; in malt producing polypeptides and amino acids (Adler) 2123; identity of oxidizing (Woker) 2257; in beer (Bau) 2284; adaptations (Bompiani) 2390; chem. nature (Bokorny) 2548, 2907; starch-forming, from malt (Born) 2562; (Krieble) 2660; protection of parasites in digestive tract against digestive (Burge) 2666; cell, and cancer (Bristol) 2667; carbohydrate, of pancreatic juice (Mellanby) 2769; detecting, in living and dead molds (Henneberg) 2903; coenzyme of yeast (Hagman) 2919; hemicellulase

(Heintz) (Windisch) (Lintner) 2964; standardization (Graber) 2968; yeast (Neuberg) 3075; of cacao (Brill) 3085; content of leaves of *Tradescantia* (Schwarze) 3086; sp., for diff. constituents of bacterial cells (Hutyra) 3091; in blood and urine in nephritis (Lorenzini) 3098; (Wood) 3143; amino N detn. in study of protective (Strauss) 3254; appearance of protective, after parenteral administration of peptone (Bassani) 3289; protective (Bronfenbrenner) 3292; pancreatic detn. in tuberculosis (Gray) 3294; see also *Ferments; Oxidases; Peroxidases*, and the individual enzymes.

Enzymes, amylolytic (Rosenthal) 1493.

Enzymes, diastatic, hydrolysis of glycogen by (Norris) 90.

Enzymes, glucolytic (Rosenthal) 1493.

Enzymes, peptolytic, sp., in urine (Sagel) 92; peptic strength of yeast (Bokorny) 349; peptolysis in germinating seeds (Court) 1345; in urine of rabbits after burning or photodynamic injury (Pfeiffer) 1506; action on polypeptides (Clementi) 2910; action on catalase solns. (Winkler) 3254.

Enzymes, proteolytic, resistance of tissue to (Langenskiöld) 649; test of pregnancy and gynecologic disease (Lohmeyer) 922; chemistry of (Herzfeld) 1489; in malt (Westergaard) 1821; in portal blood (Falls) 2665; formation of sp., in response to parenteral introduction of foreign protein (Taylor) 2931; action on catalase solns. (Winkler) 3254.

Eosin, action on bacteria, ferments and mold fungi (Zeiss) 814.

Ephedrine (Schmidt) 2234.

Epibromohydrins, optically active (Abderhalden) 310.

Epichondrosic acid (Levene) 1768.

Epidermis. See *Skin*.

Epifucose and derivs (Votocek) 1916.

Epigenesis, ascension theory and, in ore deposits (Sachs) 579.

Epihydrin alcohol, optically active (Abderhalden) 310.

Epihydrinaldehyde dimethylacetal (Wohl) 1050.

Epi-isosaccharic acid (Levene) 1768; configuration (Levene) 2078.

Epilepsy (Pollock) 3287; Br therapy in (Brodsky) 3298.

Epinephrine, action on eye (Mattirolo) 106 (Loewy) 651; temp. and, glucosuria (Nardelli) 223; in blood of children (Spolverini) 225; pharmacy of (Beckwith) 235; influence of *d*-suprarenine on blood conc. (Donath) 479; glucosuria (Blum) 479 (Airila) 1203; synergism of normal serum and (Moog) 650; and allantoin excretion (Falta) 657; and sugar mobilization in liver (Dresel) 817; atheroma (Leersum) 819; variation in, content of suprarenal glands (Seidell) 1073; and coronary circulation of monkey (Barbour) 1193; influence of posterior lobe of hypophysis on alimentary (Quadri) 1500; antagonistic action on heart (Patterson) 1507; inhibition of drugs on vaso-constriction produced by (Macht) 1807; in blood at birth (Cannata) 2263; and tonus of skeletal muscle (Kuno) 2665; fever (Cloetta) 2938; effect on heart rate (Meek) 2941; action on brain (Bass) 2942; ineffectiveness of antipyretics against (Mansfeld) 2945; Rocky Mt. spotted fever treated with adrenal secretion (Smith) 3098; effects of (Burridge) 3101; and perfusing solns. (Burridge) 3101; effects on splanchnic and peripheral arteries (Hartman) 3285; production of duodenal lesions and ulcers by injections of (Friedman) 3289.

Epinephrine compounds, effect on arterial pressure of dog which had received atropine (Tiffeneau) 3099.

Epinephrine hydrochloride, discoloration of (Elphinstone) 3327.

Epinephrine-like substances, sugar-stimulating action of (Morita) 1511.

Epiphanin reaction (Angerer) 100.

Equation of state. See *Condition equation*.

Equations, Maxwell-Lorentz, for electron theory (Byk) 552; thermochem. significance of "i" in $PV = iRT$ (Bogorodskii) 2178.

Equilibrium, ionic, across semi-permeable membranes (Donnan) 171; in system: HgI_2–aniline (Pearce) 294; of HCl and gelatin (Procter) 875; temp. coeffs. of reciprocal reactions of I-iodate (Skrabal) 996; Équilibres en solution diluee (Romann, book) 1004; theory of allotropy and electromotive (Smits) 1140, 3023; ionization (Kendall) 1416; in system: H_2O–EtOH (Pushin) 1417; thermodynamics of photochem. (Schidlof) 1422; of NH_3 under 30 atms. (Tamaru) 1423; stability of thermodynamic (Schidlof) 1423; ductless glands, internal secretions and hormonic (Garrison) 1500; gas (Scheffer) 1562; NH_3, at atm. pressure (Haber) 2013; formation of hard salts, etc., and, scheme of van't Hoff (Rózsa) 2045; invariant, monovariant and divariant (Schreinemakers) 2728; hydrogenation (Padoa) 736, 3008; calcn. of, constant (Goebel) 745; thermodynamics of SO_2Cl_2 (Trautz) 3008; in salt perfusing solns. (Burridge) 3101; Fe-C, diagram (Ruff) 3209; keto-enol, of oxaloacetic acid, etc. (Hantzsch) 3240; in "stiffening" of starch (Katz) 3375; see also *Binary systems; Ternary systems; Systems*, etc.

Equi-partition hypothesis (Stewart) 1575; in system of particles (Tolman) 1562.

Erasure, ability of paper to withstand (Maddox) 3129.

Erbium ethyl sulfate, morphotropic relations with other rare-earth Et sulfates (Jaeger) 990.

Erepsin (Rice) 1623; hydrolysis of proteins by (Anderson) 2908.

Ergometer, calibration of (Benedict) 2914.

Digitized by Google

Ergot, poisoning (Rosenbloom) 108; toxicology of (Marino-Zuco) 900; Russian barley (Schneider) 1826.

Ergotinine, isolation of, in ergot poisoning (Rosenbloom) 108.

Erosion of guns 3206.

Erucic acid, isomerism of (Mascarelli) 1761.

Erythrene (Bayer & Co.) P 396, 1136, 2608.

Erythritol, colloidal solns. of S and Se in (Velmarn) 546; test for (Mandel) 3081.

Erythrocytes. See *Blood corpuscles, red.*

Erythrodextrins. See *Dextrins.*

Erythrol structure (Zerner) 600.

Eserethrole and derivs. (Polonovski) 3221.

Eserine. See *Physostigmine.*

Eserinesulfonic acid (Polonovski) 3223.

Eseroline, derivs. (Polonovski) 3221.

Eserolinesulfonic acid (Polonovski) 3223.

Essences, detg. alc. in 692; of *Helichrysum saxatile* (Francesconi) 1094.

Essential oils. See *Oils, essential.*

Essonite (Wittich) 43.

Esterase of castor beans (Falk) 634; detg. small amts. (Bach) 3266.

Esterification, mechanism of (Baume) 547; of di- and polybasic acids (Wegscheider) 600; of cyclohexanol, etc. (Juéry) 2228; of dibasic acids (Kailan) 2342; in alc.-water mixts. (Kailan) 2343; of BzOH by mercaptans (Pratt) 2532.

Esters, action on pyrrolemagnesium bromide (Chelintzev) 87; pharmacol. action of, of choline (Dale) 104; constitution of inorg. (Schaefer) 416; of tertiary alcs. (Neumann) P 693; of polyhydric alcs. (Gen. Elec. Co.) P 850; sapon. by conc. H_2SO_4 (Bougault) 1048; content of beers (Windisch) 1089; prep. of (Bodroux) 1309; -splitting faculty of normal tissues (Quinan) 1637; sapon. with Mg and MgI_2 etherate (Zal'kind) 1748; reaction with Mg org. compds. (Stadnikov) 1754; undissoc. mol. in, catalysis (Ramstedt) 2019; haloethyl, and their hexamethylenetetrammonium salts (Jacobs) 2076; alcoholysis of (Madinaveitia) 2643; sapon. of, of dicarboxylic acids (Wegscheider) 2881; saponification by alkalies (Wegscheider) 3007; reaction of, with iodomagnesium alcoholates (Stadnikov) 3051, 3052.

Etching on fog nuclei (Lüppo-Cramer) 273; glass 700; Cu (Nefgen) P 782; printing plates (Lauthe) P 1127 (Rotophot-A.-G., etc.) P 1230 (Hoh & Hahne) P 2356; prepg. surfaces for (Albert) P 1283; of Japanese quartz (Ichikawa) 1445; reagents (Hudson) 1596; metal (Alpine-Maschinenfab.-Ges.) P 2297 (Stead) 2370 (Groschuff) 3151; bath for producing, [illegible] P 2712; molten Zn as r[illegible]ic, of Fe and steel [illegible]) P 3218; plates

[illegible]stem C_3H_8–HCl (Burrell) 1329;

system C_3H_6–C_3H_8 (Prins) 1564; v. p. of (Burrell) 2350.

Ethane-α,β,β-tricarboxylic acid, action of chloromethyl ether on Na deriv. of Et ester (Simonsen) 2516.

Ether (ethyl). See *Ethyl ether.*

Ether (of space), Sagnac effect and (Witte) 17.

Etherates, action of CO_2 on, of alkyl Mg halides (Chichibabin) 1751; of Al iodide (Domanitzkii) 1899.

Ethereal oils. See *Oils, essential.*

Etherification of *o*-hydroxyazo compds. (Charrier) 792; of leuco derivs. of indigo dyes (Chilikin) 2507.

Ethers, methyl, of oximes (Brady) 197; alkyl, of some oximes (Alessandri) 1045; (Chem. Werke v. H. Byk) P 1096; internal unsatd. (Le Heux) 1327; (Fabriques de Produits, etc.) P 1669; oxonium compds. of H_2SO_4 with (Chelintzev) 1749; prep. from acetals (Chichibabin) 1751; basic properties of O in (Chelintzev) 1755; haloethyl, and their hexamethylenetetrammonium salts (Jacobs) 2076; hydroxy derivs. of aliphatic aromatic (Bayer & Co.) P 2568; formation of, in interaction of iodomagnesium alcoholates with esters (Stadnikov) 3052; action of Grignard reagent on, of hydroxyketonic dyes (Sirker) 3231.

Ethoxides, reactions with alkyl halides (Schroder) 544.

γ-Ethoxyacetoacetic acid, expts. on Et ester (Bradshaw) 2517.

2-*o*-Ethoxybenzeneazo-1-naphthol, Me and Et ethers, etc. (Charrier) 793.

7-Ethoxy-γ-benzopyrone-2-carboxylic acid, Et ester (Sirker) 3231.

***o*-Ethoxybenzyl chloride**, compd. with $(CH_2)_6N_4$ (Jacobs) 1611.

Ethoxycaryophyllene (Deussen) 209.

2'-Ethoxy-4',5-dimethoxy-4-bromo-2-disulfidodiphenylsulfone (Fries) 786.

2'-Ethoxy-5,4'-dimethoxydiphenylsulfone-2-sulfinic acid (Fries) 786.

Ethoxyheptoic acid (Venus) 1904.

γ-Ethoxy-α-isobutylacetoacetic acid, Et ester (Bradshaw) 2518.

Ethoxyisopropylacetoacetic acids, Et ester of α (Scheiber) 1183; Et ester (Bradshaw) 2518.

2-Ethoxy-4-methyl-5-chlorobenzoic acid and Me ester (von Walther) 2642.

1-Ethoxy-4-methyl-2-ethoxymethyl-cyclohexen-6-one and semicarbazone (Bradshaw) 2518.

2-Ethoxymethylquinoxaline and salts (Bradshaw) 2518.

***o*-1-Ethoxynaphthoylbenzoic acid** and NH_4 salt (Copisarow) 2520.

***p*-Ethoxyphenacyl bromide**, deriv. (Jacobs) 2077.

γ-Ethoxy-α-propylacetoacetic acid, Et ester (Bradshaw) 2518.

5 - Ethoxypyrimidine - 2 - thioglycollic acid (Johnson) 2656.

Ethyl acetate, analysis (Szeberényi) 574; azeotropic mixts. with H_2O (Lattey) 613; from AcH (Consortium für Elektrochem. Ind.) P 695.

Ethylacetoacetic nitrile and Na salt (Mohr) 59.

Ethylacetonoxalic acid, Et ester (Kötz) 622.

***N*-Ethyl-β-acetopiperidine** and derivs. (Lipp) 1760.

Ethyl alcohol in manuf. of H_3PO_4 and phosphates (Fox) 128; soly. of nitrocelluloses in (Schwarz) 152; colloidal As_2S_3 in system water–ether (Corliss) 169; system: colloid–water– (Scarpa) 170; production by wheat germs (Kostychev) 330; as substitute for benzine (Hempel) 372 (Watson) 1687; v. ps. of alc. solns. (Tower) 403; action of solns. of acids in, on proteins (Herzig) 467; as nutrient for molds (Baudrexel) 471; titration of milk with (Löhnis) 492 (Kooper) 1947; viscosity of blood on inhalation of (Burton-Opitz) 633; diet and hepatic lesions of (Opie) 646; soly. of LiCl in H_2O-, mixts. (Rubies) 743, 3006; soln. of boric acid in (Firth) 745; cond. of acids in (Goldschmidt) 745; injection with gasserian ganglion in neuralgia (Byrnes) 825; content of yeast (Foth) 842; absorption and oxidation by animal organs (Votz) 937; soly. of sandalwood oil in (Baring) (Italie) 952; elec. cond. and viscosity of NaI and KI in mixts. of, and H_2O (Wightman) 993; e. m. fs. in,—dropping electrode in alc. solns. (Newberry) 1000, 2476; action on Si_2Cl_6 (Martin) 1017; biol. status (Trier) 1072; agricultural (Kremers) 1091; reflex effects on circulation (Lieb) 1204; decolorizing (McKee) P 1227; soly. of soils in (Davidsohn) 1255; reaction of milk (Auzinger) 1352 (Ayers) 2555; osmotic pressure of, solns.—v. ps. and ds. (Price) 1416; equil. in system: water– (Pushin) 1417; e. m. fs. in (Furness) 1423; action on Si_2Cl_6 (Martin) 1468; C_2H_6 as substitute for, in prep. of tincture of I (Ceppellini) 1663; oxidation by phanerogams (Zaleski) 1799; system: caoutchouc–C_2H_6– (Caspari) 1868; detg. MeOH in presence of (Jones) 1887 (Wilks) 2205 (Pasienti) 2206; cond. and ionization of electrolytes in (Robertson) 2018; surface tension (Richards) 2025; France's, commerce (Peters) 2124; sepg. from AmOH (Marin) P 2124; reduction of Cu_2O in, vapor (Wedderburn) 2204; fuel 2304; ester formation in alc.-water mixts. (Kailan) 2343; reactions of NaOEt with MeI in (Robertson) 2343; detg. original gravity (Baker) 2562; alc. solns. of CdI_2 (Getman) 2615; system: H ion–H_2O–(Goldschmidt) 2617; and germicide (Comstock) 2661; decomp. of acylphenols by (Jones) 2891; sp. vol. in alc.-H_2O mixts. (Brown) 3001; kinetics of reaction of, HCl with phthalic acid (Wegscheider) 3008; soly. of uric acid in (Gortner) 3080; change in, content of yeast on standing and during autolysis (Neuberg) 3084; estn. in ether (Szeberenyi) 3190; physiol. action (Taylor) 3299; mycology and chemistry of, question (Sopp) 3322; enrichment of, with higher alcs. by vitality of yeast (Heinzelmann) 3324; from sugar (Bayer) P 3326; from waste sulfite liquor (Marchand) P 3358; see also *Fermentation; Liquors; Spirits;* etc.

Ethyl alcohol, analysis, in tropics (Browning) 117; alcoholometry (Joseph) 235; detg., in wines (Tommasi) 687 (Bosia) P 2285; detg., in perfumes, essences, etc. 692; detg., in beer (Podlogar) 118 (Lehmann) 1090; detecting substitution of denatured, for rectified (Richard) 1224; in pharmaceutical prepns. (Reuss) 1826; in alc. solns. contg. essential oils (Zuco) 2126.

Ethyl alcohol industry, rectifying (Pampe) P 120 (Schilling) P 506 (Sebastian) 843; from sugar beets (Koloczek) 691 (Ehrlich) 1824; in 1913 (Rüdiger) 1221; saccharification of starch in (Boulard) P 1223; from molasses (Owen) 1365 (Heriot) 1825; (Freeman) P 1534; from maize (Boyer) 1406; from Nipa palm swamps in Philippines 1658; utilizing 1824; yield of, from refined and raw sugar (Foth) 1825; from waste sulfite liquor (Ekström) 1825 (Landmark) 2709; from cassava (Collens) 2284; in Italy (Cettolini) 2284; fermentable liquid as source of (Guadagnini) P 2324; (Thatcher) P 2564; manuf. for perfume (Stockelbach) 2688; from wood (Hägglund) 3127.

1 - Ethyl - 2 - allylmercapto - 4 - methyl - 6 - oxypyrimidine (Johnson) 1066.

Ethylamine-*N*-phosphinic acid, Et and Ph esters (Michaelis) 1031.

Ethylaminodibenzanthrone (Bally) P 1122.

Ethyl 4-amino -3,5-dibromophenyl ether (Fuchs) 1463.

Ethylammonium compounds of chromates and dichromates with $Hg(CN)_2$ (Strömholm) 1437.

Ethylammonium hexabromo-osmiate (Gutbier) 1439.

Ethylammonium pentachlororuthenate (Gutbier) 2196.

Ethylanilinium hexabromo-osmiate (Gutbier) 1439.

Ethylbenzylanilinium hexabromo-osmiate (Gutbier) 1439.

1-Ethylberberinal (Freund) 2873.

Ethyl bromide, reaction with NaOEt (Marshall) 3155.

***N*-Ethylbutyl methyl ketone** and derivs. (Lipp) 1760.

9 - Ethylcarbazole - 3,6 - diphthaloylic acid (Copisarow) 2520.

9 - Ethylcarbazole - 3 - phthaloylic acid (Copisarow) 2520.

Ethyl carbonate, interaction of pyrrole-metallic compds. with (Chelintsev) 1472.

Digitized by Google

Ethyl chloride, use in sterilizing bacterial cultures (Berthelot) 2394.
Ethyl chlorocarbonate, interaction of pyrrole-metallic compds. with (Chelintsev) 1472.
2-Ethylcoumarone (Stoermer) 1054.
Ethylcyclopentamethylenebismuth (Grüttner) 3249.
Ethylcyclopropane (Filipov) 1905.
Ethyldihydroberberines, 1- (Freund) 2873; 4- (Freund) 2873.

1-Ethyl-2-dimethyl-5-phenylpyrrolone and salts (Immendörfer) 1914.
Ethyldi-*n*-propylcyclohexylmethane (Halse) 3232.
Ethyl disulfide, change into EtSH (Neuberg) 3058.
Ethylene, fusibility curve for system C_2H_5–Me_2O (Baume) 547; sepn. from ethane (Burrell) 1329; detection by castor oil plant (Harvey) 1591; v. p. of (Burrell) 2350; hydrogenation of (Paal) 2380 (Rather) 2653; analyzing gas mixts. contg. (Gautier) 3123.
Ethylenebischloroacetamide (Jacobs) 2074.
Ethylenebis-[α-imino acids] (Schlesinger) 74, 2068.
Ethylenebis-[α - imino - α,α - diphenylacetic] nitrile (Shlezinger) 2068.
Ethylenebis - [α - iminoisobutyric] acid and derivs. (Shlezinger) 2068.
Ethylenebis - [α - iminoisobutyric] nitrile and derivs. (Schlesinger) 75.
Ethylenebis-[α-imino-octanic] acid and derivs. (Shlezinger) 2068.
Ethylenebis - [α - imino - octanic] nitrile and derivs. and corresponding acid (Schlesinger) 74.
Ethylenebis - [α - iminophenylacetic] acid and derivs. (Shlesinger) 2068.
Ethylenebis - [α - imino - α - phenylpropionic] acid and derivs. (Shlezinger) 2068.
Ethylenebis - [α - iminopropionic] acid and derivs. (Shlezinger) 2068.
Ethylene bromide, conversion of compds. of type of, into glycols (Bainbridge) 205; ternary mixts. of toluene, CCl_4 and (Rosanoff) 402.
Ethylenediamine, AcH from (Neuberg) 58.
Ethylenediammonium dioxalodiaquochromiate (Werner) 35.
Ethylenediammonium dioxalohydroxoaquochromiate (Werner) 36.
Ethylenediammonium hexabromo-osmiate (Gutbier) 1439.
Ethylenediammonium pentachlororuthenate (Gutbier) 2196.
Ethylenefluoroacetin (Swarts) 442.
Ethylene glycol, AcH from (Neuberg) 58; reduction of glycolaldehyde to (Neuberg) 3058.
Ethyleneglycol *d*-β-galactoside, biochem. synthesis of (Bourquelot) 1913, 3070.
Ethylene halides, differences in reaction of stereoisomeric (Pfeiffer) 2534.
Ethyl ether, system: water–ether–alc. (Corliss) 169; purity and post-anesthetic glucosuria (Ross) 335; b. p. of (Finnemore) 353; system: H_2O–KI–HgI_2–Et_2O (Dunningham) 401; and enzymic activities of bulbs and tubers (McCool) 475; compds. of $NiBr_2$ with (Ducelliez) 565; recovery tube (Pickel) 873; filter-pipet for (Pickel) 873; influence of, narcosis on variation in blood sugar content (Hirsch) 1203; oxidation of (Isham) 1329; soly. of citric acid (Hill) 1665; exam. of com. (Ellis) 1667; vaccine sterilized by (Vincent) 1935; as fuel 2304; action on ductless gland system (Marchetti) 2673; rate of evapn. from oils (Baskerville) 2769; diffusion of iodoeosin from, through rubber into (Rosenbloom) 3071; soly. of urea and of uric acid in (Gortner) 3080; dextrose and diastase content of blood as affected by, anesthesia (Ross) 3099; action of, and Ra or X-rays on eggs and embryos (Haecker) 3102; action on inversion of sucrose in beet (Mazé) 3141; estn. of EtOH in (Szeberenyi) 3190; sugar during, narcosis in phlorhizinized dogs (Sansum) 3277; see also *Etherification*.
β-Ethylgalactoside, biochem. prep. of (Bourquelot) 1047.
α-Ethylglucoside, prep. of (Aubry) 1048.
Ethylglyoxal and semicarbazone (Dakin) 202.
Ethylglyoxalacetal (Dakin) 202.
Ethyl halides (Anilin-Fab.) P 1829.
Ethylhydrocuprein (Morgenroth) 1668; action on type strains of pneumococci (Moore) 2921; and pneumococcal infection (Moore) 3100.
1-Ethyl-4-hydroxydihydroberberine and derivs. (Freund) 2873.
Ethylidenebis-α-ethoxyacetoacetic acid, Et ester (Bradshaw) 2518.
Ethylideneglycol, ethers and esters of (Griesheim-Elek.) P 149, 356.
1 - Ethylidene - 4 - methyldihydroberberine and derivs. (Freund) 2874.
Ethylidenetrimethylene (Favorskii) 1750.
Ethylimidoacetylacetone and benzoate, etc. (Rügheimer) 306.
α-Ethylindone and semicarbazone (Stoermer) 1758.
Ethyl iodide, reaction with NaOEt (Marshall) 3155.
Ethylisobebeerine, ethiodide (Scholtz) 2080.
Ethylisopropylbutylcarbinol (Wallach) 1458.
Ethylisopropylbutylenecarbinol (Wallach) 1458.

Excretion of radioactive substances (Flesch) 105; **of dyes and vital staining of kidneys**

Digitized by Google

(Gross) 222; action of HCl on, of alkali (Secchi) 477; epinephrine and allantoin (Falta) 657; of creatinine during a creatine-free diet (Ringer) 817; influence of $NaHCO_3$ on, of NaCl and intravenously injected lactose (Goldberg) 1203; of antigen (Porter) 1639; influence of cholesterol on, through bile (D'Amato) 1800; acid, in nephritis (Henderson) 1937; rate of (McLean) 1939; of sol. Ra salts (Seil) 2672; role of digestive glands in, of endogenous uric acid (Mendel) 2927; numerical laws governing rate of, of urea and chlorides in man (McLean) 2928, 2946; of urobilinogen (Sieber) 3096; of phenols and derivs. (Folin) 3272; see also the specific excretory products as *Creatine*, etc.

Exhalations of Etna (Ponte) 1449; anaphylactogenic properties of, of mice (Messerschmidt) 2552.

Exosmosis. See *Osmosis*.

Expansibility product (Gay) 985.

Expansibility tension and theory of hydrates (Gay) 2478.

Expansion at low temps. (Valentiner) 12; thermal, of solns. of gelatin in water (Scott) 172; of ferro-Ni (Chevenard) 432; thermal linear, of cuprite and diamond (Röntgen) 574; of mixts. of CS_2 and acetone (Varona) 994; thermal, of Na, K and Li (Bernini) 995; of glazes (Rieke) 1676; leading-in wire of desired coeff. (Eldred) P 1721; of solids (Valentiner) 2024; thermal, of Hg and fused SiO_2 (Harlow) 2024; temp. of petroleum residuums (Rossbacher) 2309; of milk and cream (Bearce) 2782; of Na (Griffiths) 3018; of minerals, rocks and corresponding art. products (Schulz) 3045; of quartz glass (Scheel) 3149; of solns. (Cabrera) 3156; of cork particles (Grunzweig) P 3333.

Explosibility of NH_3-air mixts. (Schlumberger) 862; of CH_4-air mixts. (Burrell) 1844; of sugar dust (Wheeler) 3362.

Explosions of iron C_2H_6 nitrating app. (Pikos) 152; elec. main 246; energy required to start gaseous (Thornton) 378; gaseous (Anon.) 378 (Clerk) 965 (Hopkinson) 1117; of drying-house for smokeless powder 380; in sewer (Clark) 679 (Burrell) 2815; flame velocities in gas and dust (Morgan) 716; picric acid (Anon.) 716 (Cooper-Key) 965; of kerosene lamps 1117; of elec. transformer 1117; preventing propagation of (Jonides) P 1118 (Schurmann) P 2314; limiting coal-dust (Kruskopf) P 1118, 1393; in gas pressure conduits of coke ovens (Kress) P 1243; effect of pressure on combustion of explosive mixts. of gas and air (Terres) 1248; septic tank, at Florence, N. C. (Moffitt) 1249; preventing, in mines (Kempermann) P 1249 (Cremer) P 1845 (Rice) 2453 (Höing) P 2593; in balloon 1393; in mines 1393; at factory of Schultze Co. (Desborough) 1547; recording pressure variations due to, in tubes (Morgan) 2149; in nitroglycerin plant (Cooper-Key) 2150; at Hojo colliery, Japan (Meguro) 2150; of paper dust 2312; preventing, of vapors of ether, benzene, etc. (Grosvenor) P 2313; in mixing house (Coningham) 2592; of nitro-cotton (Coningham) 2592; minimizing effects of colliery (Allison) P 2815; from defective gas service governor (Reinhard) 2983; total radiation from gaseous (Thornton) 3016; at dye works 3362; preventing (Martini) P 3363; see also *Coal dust*.

Explosive gases. See *Gases*.

Explosives, perchlorate 151; pressure produced in detonation (Hopkinson) 151; in Italy (Molinari) 151; in coal mines 152, 1247; production in U. S. in 1913 (Fay) 152; rept. of chief bureau of ordnance navy dept. for 1914 380; 38th ann. rept. of H. M. Inspector of (Cooper-Key) 714; contg. As (Müller) 715; new coal mines order 715; Germany's foreign trade in 716; in warfare (Macnab) 965; C_2H_2 1115; explosive properties of fulminates and azides (Wöhler) 1115; direct-detonating 1116; new Swedish (Herlin) 1116; in India (Baker) 1117; diphenylamine in (Bradley) 1117; gas. ind. in manuf. of (Lewes) 1239; detonation (Stettbacher) 1248; transportation (Dunn) 1392; modern (Lewes) 1392; (Parker) 1394; piercing *vs.* explosive shells 1547; primer on (Munroe) 1547; their Manuf., Properties, Tests and History (Marshall, book) 1547; coal-tar products in (Storm) 1844; drying app. for (Schweizer) 1844; accidents in, ind. (Badermann) 1845; in Greece (Logothetis) 1845; Die Brisanz und Explosionsgeschwindigkeit moderner Sprengmittel (Kast, book) 1995; system: nitroglycerin–guncotton–nitroglycerin vapor (Chiaraviglio) 2148, 2149; Am. table of distances (Assheton) 2150; handling, storing, etc. 2150; storage magazines 2150; production in U. S. in 1914—coal mine accidents (Fay) 2453; résumé (O'Hern) 2453; tolerance in tests 2591; (Lewes) 2592; blasting 2592; high (MacDonald) 2592; liquid air (Pryzborski) 2710; 39th Ann. Rept. of H. M. Inspectors of (Cooper-Key) 2980; gases in coal mines (Darton) 2982; permissible (Howell) 2982; Die Explosivstoffe mit besonderer Berücksichtigung der neueren Patente (Escales, book) 2983; efficiency of tamping (Collins) 2983; covolume of gases evolved by (Berthelot) 3152; (Buchner) 3360; modern munitions of war (Lewes) 3360; Die Nitrosprengstoffe (Escales, book) 3362. *Patents:* (Classen) 153, 1249; (Carlson) (Ohno) 380; (Vergé) (Hartmann) 381; hexanitrodiphenyl sulfide (Sprengstoff- A.-G. Carbonit) 381; Sprengel (Hawkins) 381, 2815; (Burgschmiet) 526; nitrotoluene (Maire) 716; (Woodbury) 717; for blasting (Cole) 717 (Schanandoah) 1845; (Ver. Cöln-Rothw. etc.) 862; liquid air and C

carriers (Baldus) 863; (Sparre) 1118; detonating (Wöhler) 1118 (Main) 2592; gelatin (Maire) 1118, 3363; (O'Brien) (Herlin) 1249; cartridge contg. liquid air or O (Claude) 1249; (Buggschmiet) (Pala Companhia, etc.) (Soc. L'air liquide) 1693; (LeChatelier) 1995; charging shells with fusible (Deut. Sprengstoff-A.-G.) 1995; stabilizing nitro (Stoltzenberg) 2313; (Stoltzenberg) 2313; (Soc. "La Sabulite" 2314; exploding charges (Baldus) 2453; (Charbonneaux) (Hoynes) 2453; from nitroiosbutylglyceryl trinitrate (Matthews) 2453; (Pearcy) 2593; propellent (MacNab) 2593; (Woodbury) 2710; (Raschig) 2815; Al safety (Sesti) 2815; neutralizing noxious fumes (MacCauley) 2983 (Mawdsley) 3130; (Metcalfe) 3130; NH_4NO_3 (Grorud) 3363; (Burrows) (Spica) 3363; see also *Blasting; Coal dust; Detonation; Detonators; Nitrocellulose; Nitroglycerin; Powder; Priming compositions*, etc.

Extinguisher. See *Fire extinguisher.*

Extraction of hops (Horst) P 1222; of egg yolks with acetone (Fendler) P 2291; of fats (Netz & Co.) P 2605; by immiscible solvents (Self) 2691; velocity of org. acids (Pinnow) 2732; fat, of leather (Levi) 2994.

Extraction apparatus. See *Apparatus, extraction.*

Extractor. See *Apparatus, extraction.*

Extracts, simplifying detn. of, in beer (Podlogar) 118; detn. in malt (Doemens) 119; detn. in barley-autoclave (Engelhard) 119, from crayfish (Kutscher) 487; action on small intestine (Young) 1941; importance in diet (Aron) 2663; purification of alc., from maceration of putrefying viscera, etc. (Magnin) 2748; in therapeutics (Pescitelli) 2794; of wine detd. by xanthydrol method (Maestro) 2911; of muscular tissue (Smorodintzev) 3088; see also *Flavoring materials; Organ extracts; Tanning materials.*

Exudates, differentiation between, and transudates (Maiolo) 3266.

Eye-glass, cement for, mountings (Uhlemann) P 1671.

Eyes, action of epinephrine on (Mattirolo) 106 (Loewy) 651; idiosyncrasy of, to atropine (McEnri) 107; effect of subconjunctival injections of NaCl on ocular tension (Verderame) 107; administration of I during use of Hg in (Grumme-Fohrde) 661; radiant energy and the lens and humors of (Burge) 811; anaphylactic inflammation of (Köllner) 1504; protecting, from infra-red rays (Coblentz) 1674; effect of drugs on vessels of pia mater and retina (Hirschfelder) 1940; do chem. rays penetrate upper eye-lid? (Solger) 2905; transmission of infra-red rays by media of (Hartridge) 3069; of nocturnal insects (Buginon) 3102; isotonic, washes (Siboni) 3116; see also *Lens.*

Fabrics, rubberized balloon (Barr) 2007; measuring impermeability of (LeRoy) 2595; chemistry of papermaking (Bates) 2979. *Patents:* impregnating (Lloyd) 384 (Destribats) 1124 (Anhydrat-Leder-Werke A.-G.) 3378; for covering walls, books, etc. (Wiggin) 721; coating (Higham) 732; embossing (Wilkinson) 864; carbonizing (Zemann) 865; for air-craft (Weil) 1123; book-binding (Hansel) 1123; lace, edging, etc., on dress goods (Bamberger) 1124; sepg. vulcanized rubber from (Frydmane) 1135; preserving (McLarty) 1229; satinizing cotton (Dutschke) 1251; imitating (Manufakturen-G., etc.) 1391; bleaching (Golodetz) 1396 (MacIlwaine) 1550; designs on (Diener) 1550 (Heberlein & Cie) 1396; cleansing comp. for (Bertlett) 1549; metallic coatings on (Metallatom) 1550; polychrome effects in (Heinzel) 1550; ornamenting textile (Linfoot) 1694; textile (Vogel) 1694; stiff-dressing wide mesh multi-ply (Elster) 2153; as foundations in vulcanized rubber goods (Muntz) 2327; rubberized cotton (Muntz) 2328; impregnated with rubber (Fränkel) 2468; bleaching and cleaning (Fink) 2817; removing stains from textile (Stevenot) 2818; for filter cloths (Morson) 2818; finishing cotton (Heberlein & Co.) 3133; pattern effects on mercerized cotton (Heberlein & Co.) 3134; from cellulose (Beatty) 3358; see also *Textiles; Fibers; Dyeing; Fireproofing; Waterproofing; Wool,* etc.

Factis production (Halen) 395.

Factory, Modern (Price, book) 515; treated timber for, construction (Hoxie) 2138; pneumatic conveyors in (Brauer-Tuchorse) 2472.

Fagara xanthoxyloides (Oestling) 351.

Fallopian tube, anaphylactic response of (Weil) 3292.

Fan for conducting acid gases and vapors (Deutsche Ton-, etc.) P 1263.

Faraday effect, media showing negative (Voigt) 13.

Faratsihite (Lacroix) 1289.

Farina, flavone as, of *Primula* (Müller) 2549.

Farming. See *Agriculture.*

Fasting. See *Inanition.*

Fastness, light, of dyeings (Gebhard) 717; of direct coppered blues (Edge) 2984; detg., of dyes (Sirker) 3364.

Fatigue of metals (Stromeyer) 777 (Kreuzpointer) 1893; of Cu alloys (Jonson) 2372, 2637; creatinine in muscles and behavior of creatine during (Scaffidi) 2931; com. adoption of, test (Batson) 3207.

Fats, influence on gastric digestion of milk (Rocci) 96; in sputum (Barbaro) 101; grease traps (Thompson) P 114; cadaver (Dubovitz) 159; sepg. liquid from solid fatty acids in (Waele) P 159; enzymes that decompose, in organs (Porter) 212; chicken (Pennington) 220; optical behavior of unsapon. matter of (Berg) 249; decomp. of, into glycerol and fatty acid by Twitchell reagent (Wilmart) 250; optically active (Abderhalden) 310;
